Course Schedule

2:00 pm - 2:10 pm Welcome and Introductions, **Matusik**

2:10 pm - 3:00 pm 3D Printing Hardware/Software, **Matusik**

3:00 pm - 3:30 pm Appearance Fabrication for 3D Printing, **Bickel**

3:30 pm - 3:45 pm Break

3:45 pm - 4:15 pm Design and Fabrication of Deformable Objects, **Bickel**

4:15 pm - 4:45 pm Structurally Robust 3D Printing, **Umetani**

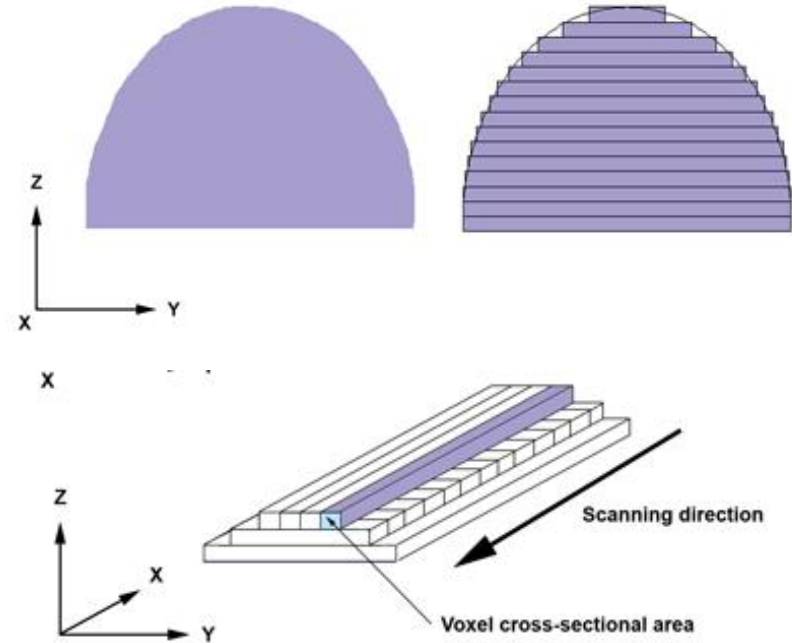

4:45 pm - 5:00 pm Interactive Physics Simulation for Personal Fabrication, **Umetani**

5:00 pm – 5:15pm Conclusions, Q&A, **All**

Course Overview

Basics of 3D Printing

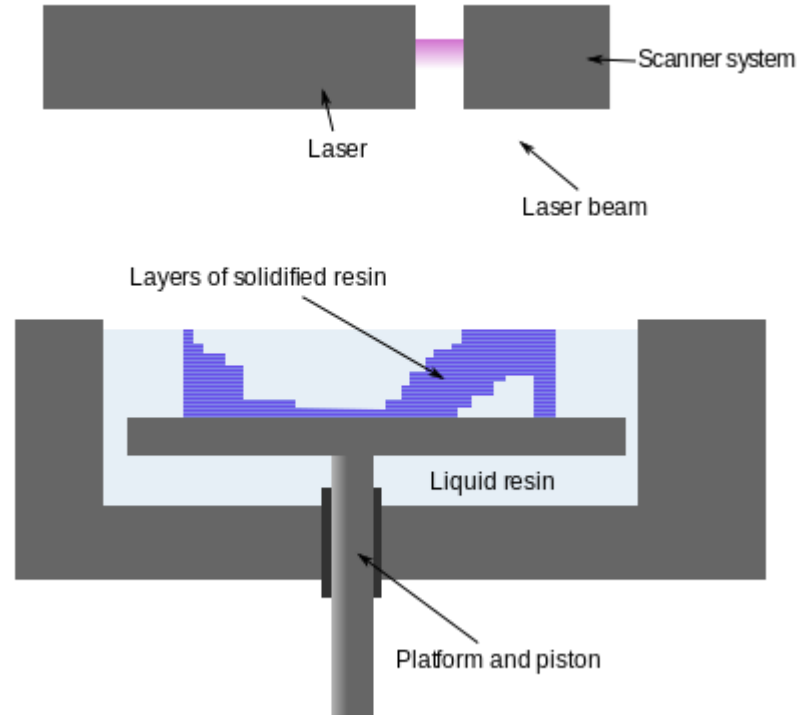

- What 3D printing is?
- How does it work?
- What are the applications?

3D Printing Hardware and Materials

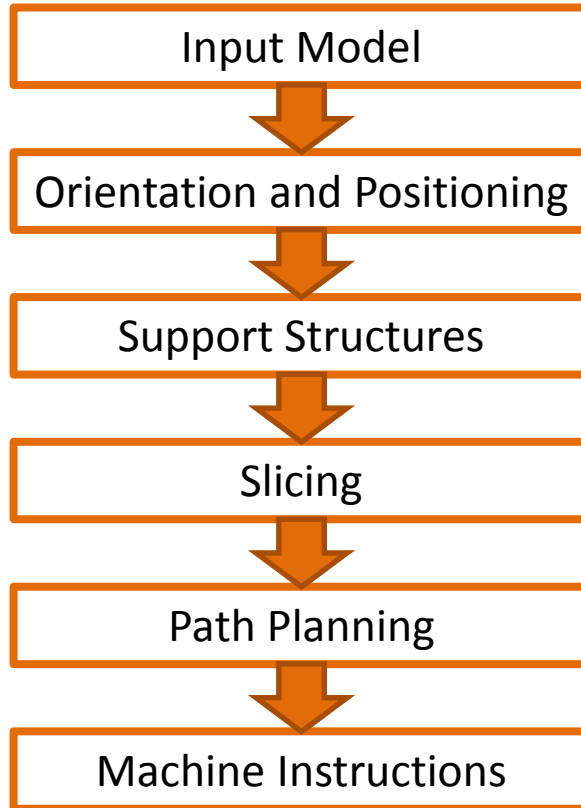

Fused deposition modeling

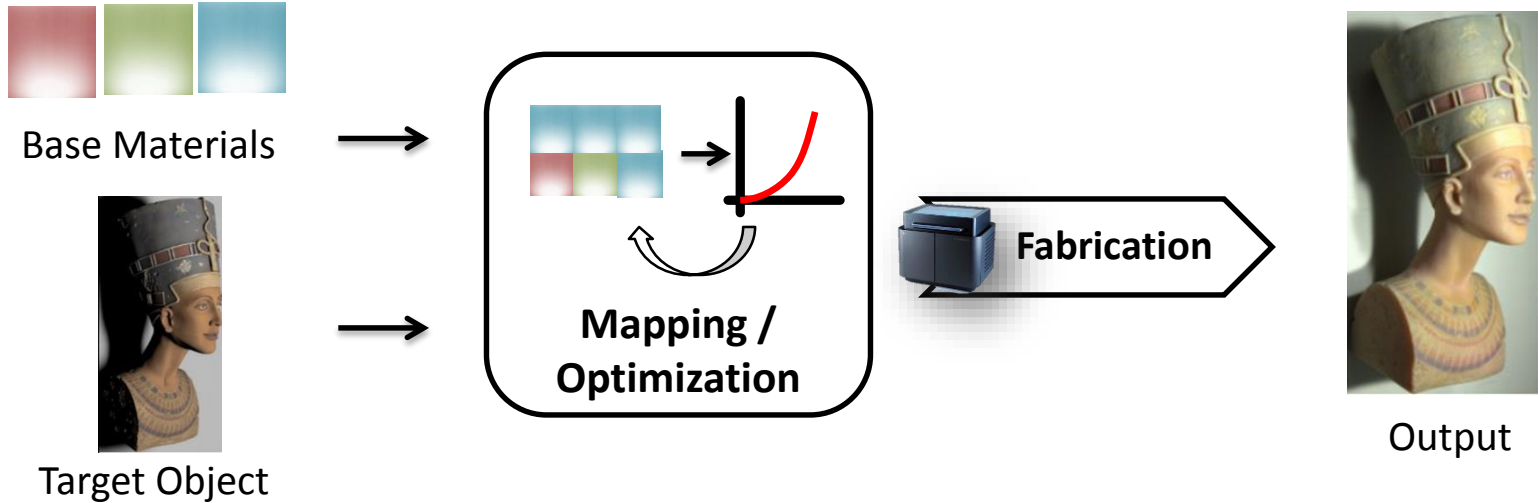

Stereolithography

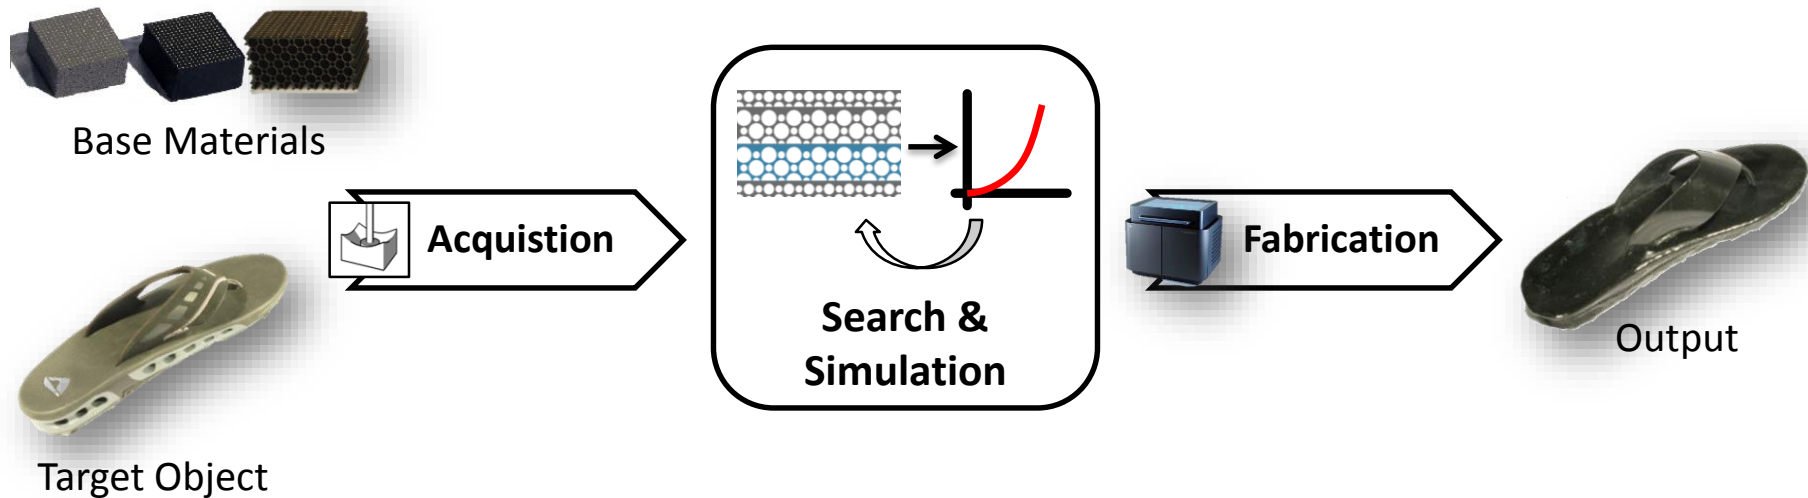

3D Printing Software Pipeline

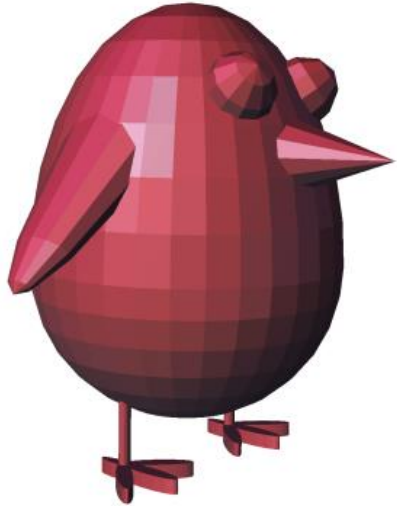

Appearance Fabrication for 3D Printing

Designing Deformations for 3D Printing

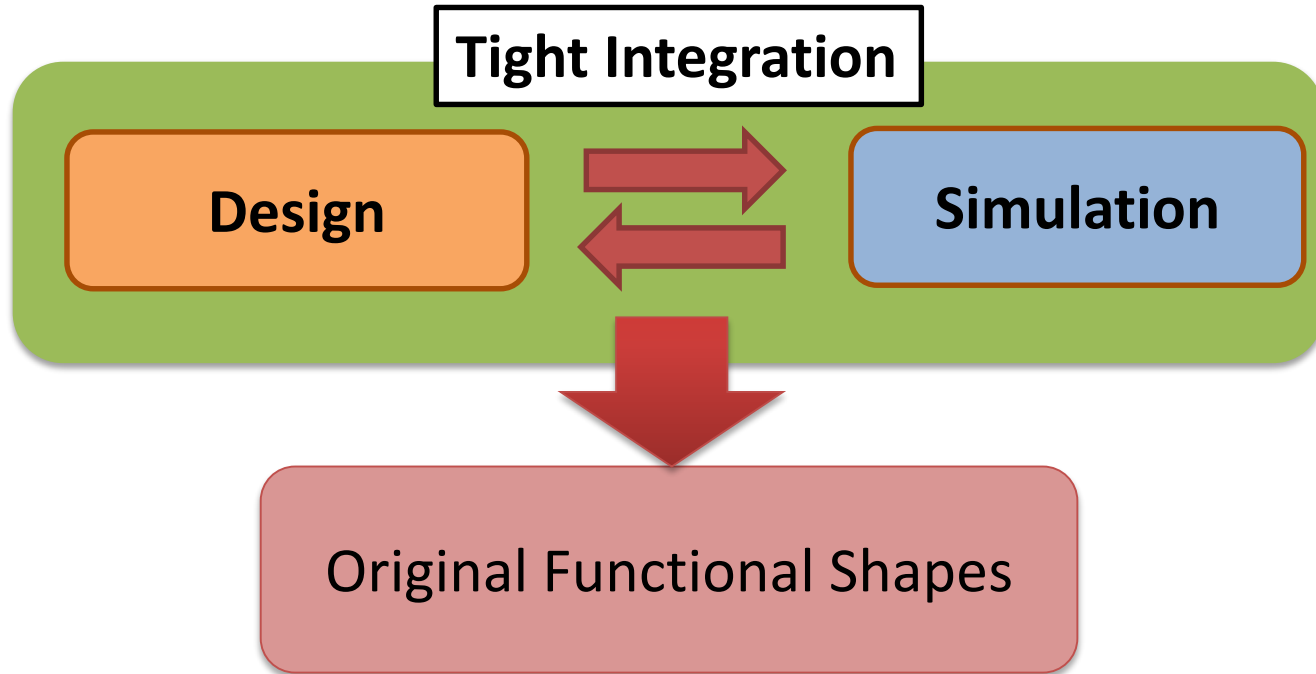

Structurally Robust 3D Printing

3D printing

Interactive Physics Simulation for Personal Fabrication

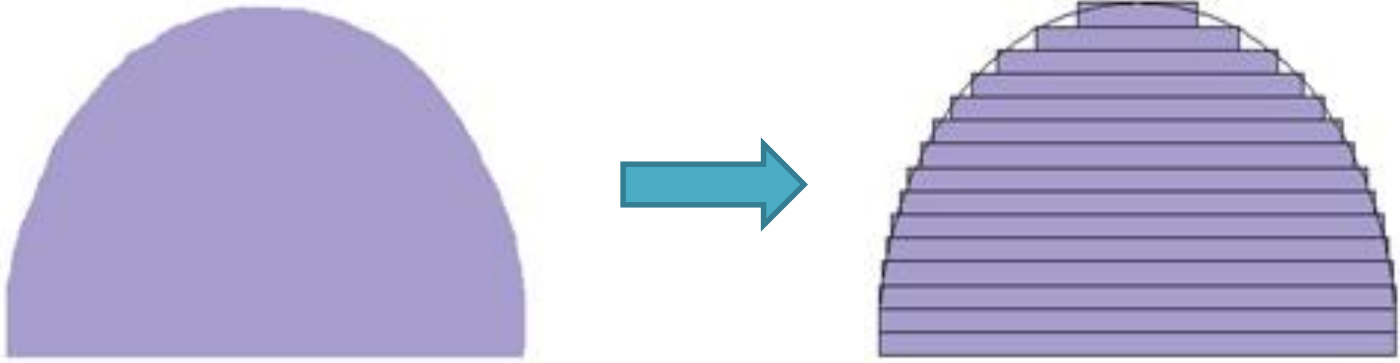

3D Printing Basics

3D Printing = Additive Manufacturing

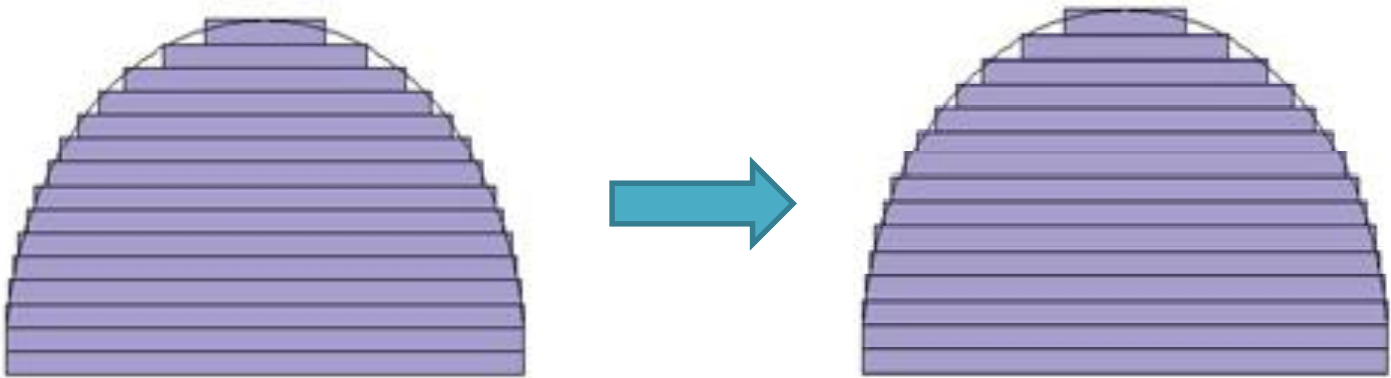

3D Printing Process

- Slice 3D model into layers

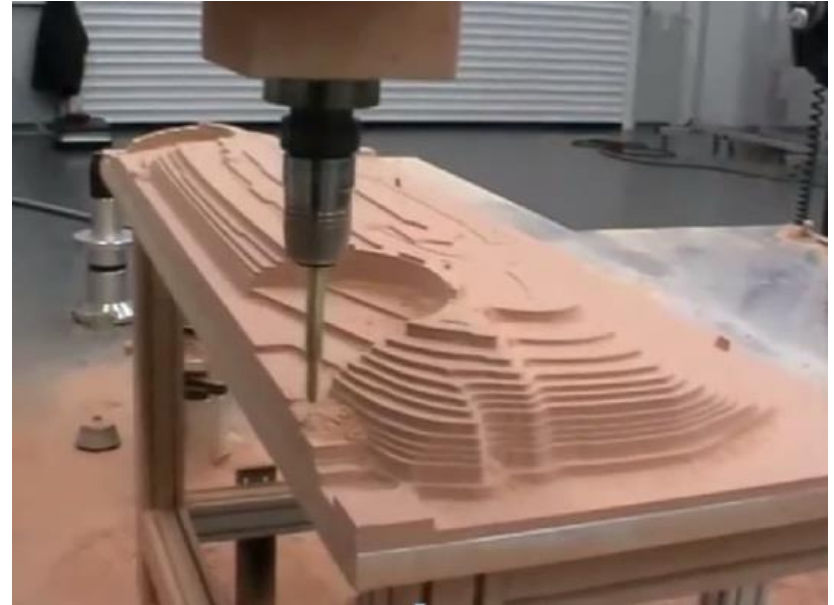

3D Printing Process

- Slice 3D model into layers
- Manufacture layers one by one (e.g., bottom-up)

Subtractive Manufacturing

- Start with a block of material
- Remove material to obtain a given 3D shape

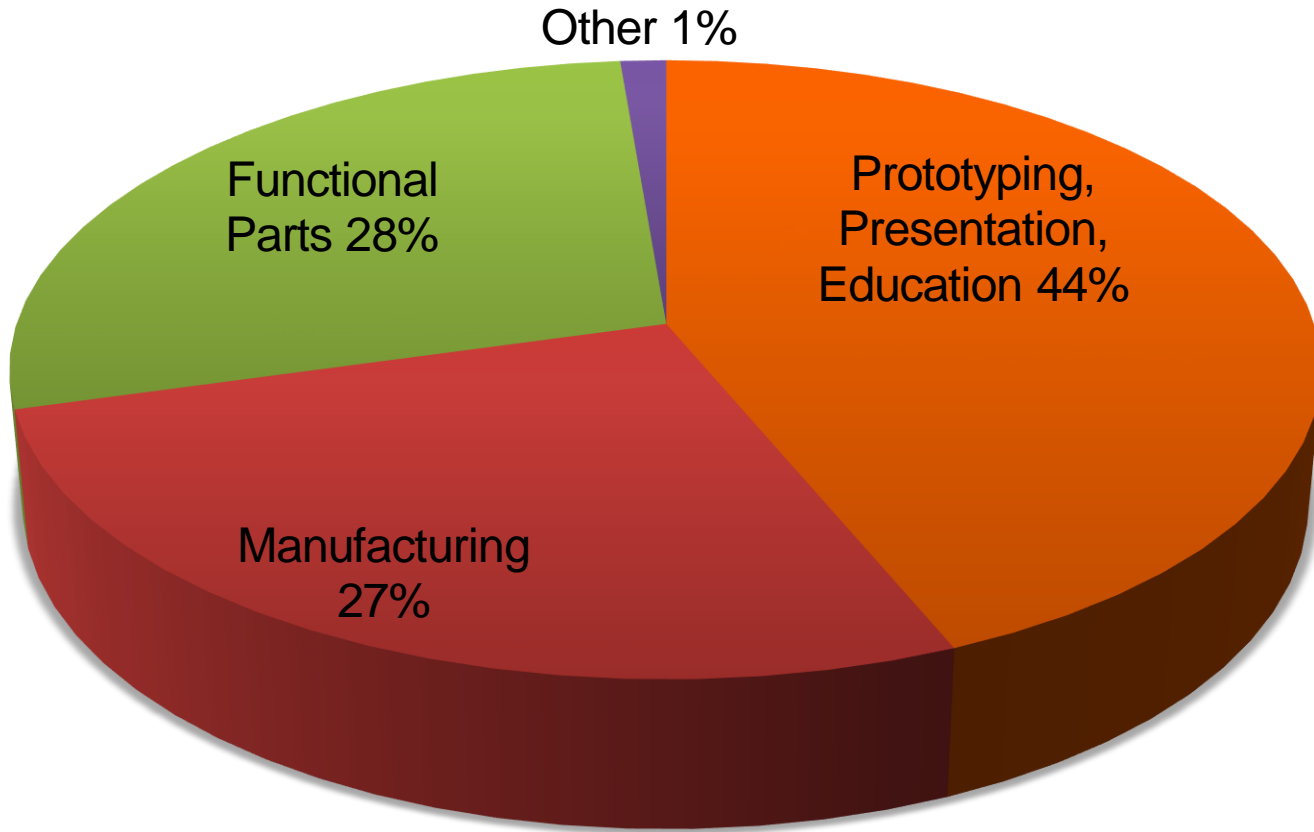

Additive Manufacturing Technologies

- Fused deposition modeling (FDM)
- Stereolithography (SLA)
- DLP 3D printing
- Selective laser sintering (SLS)
- Direct metal laser sintering (DMLS)
- Plaster-based 3D printing (PP)
- Photopolymer Phase Change Inkjets
- Thermal Phase Change Inkjets
- Laminated object manufacturing (LOM)

Why Additive Manufacturing?

- Good for custom parts or short production runs
- Can build objects with complex geometry
- No (or little) waste material

What Is 3D Printing Used For?

Applications: Dental and Medical Industries

Crowns, copings, bridges

Custom Hearing Aids

Implants

Prosthetics

Applications: Architecture & Design

Source: aecbytes.com, Z Corp, object.com

Applications: Automotive

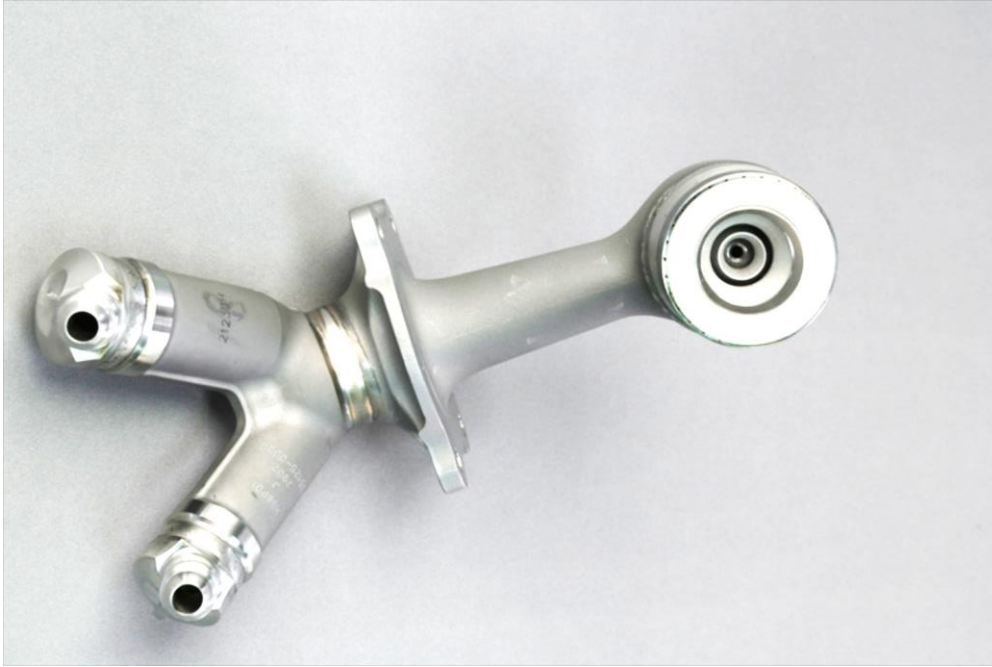

Honeycomb
Tires

3D Printed Ventilation Prototype
(High Temperature 3D Printing Material)

Applications: Aerospace

3D printed fuel injection nozzle for a jet engine

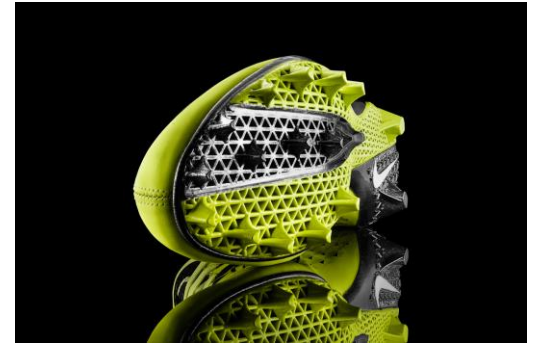

Airbus wing brackets

Applications: Jewelry

- Direct metal printing and casting patterns

Applications: Footwear

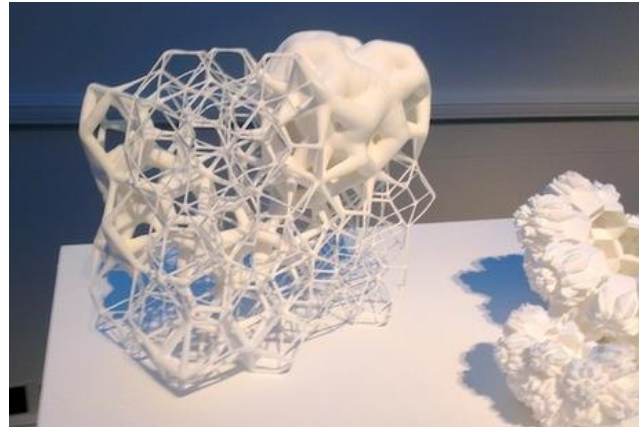

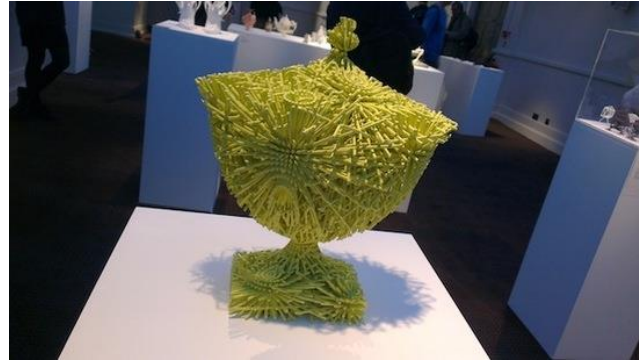

Applications: Consumer Home Products

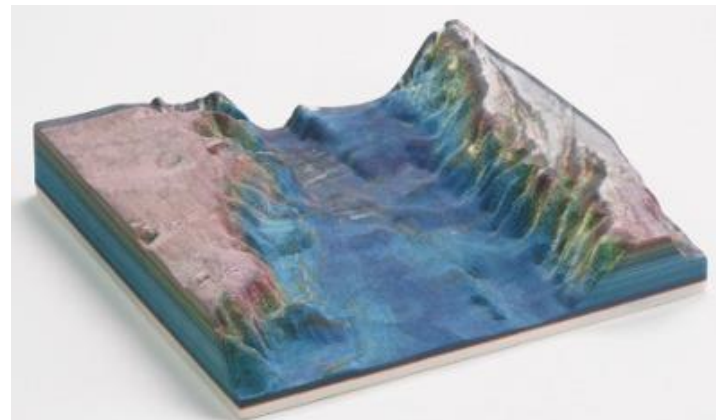

Applications: Toys & Gadgets

Applications: Art

Applications: Education

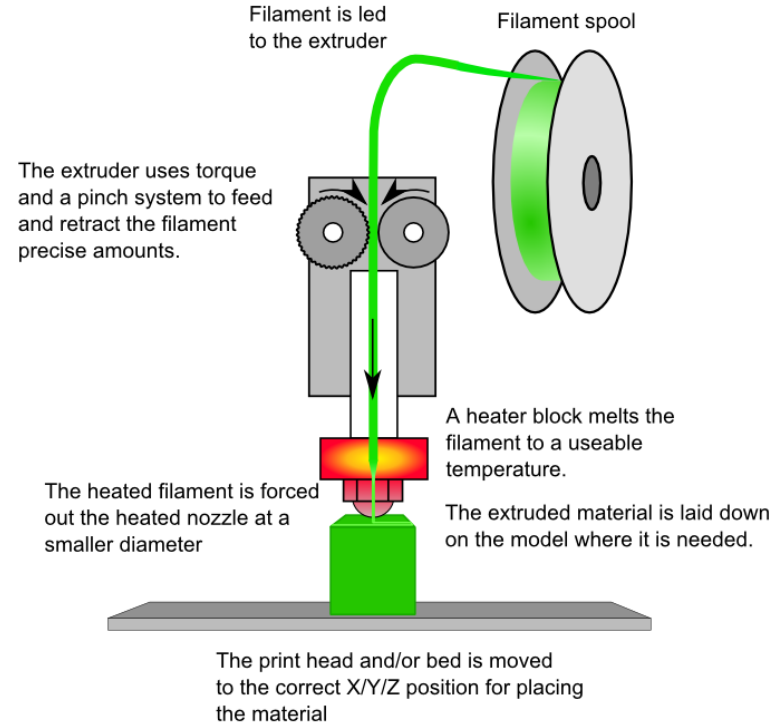

3D Printing Hardware and Materials

Additive Manufacturing Encompasses Many Different Technologies

- Fused deposition modeling (FDM)
- Stereolithography (SLA)
- DLP 3D printing
- Selective laser sintering (SLS)
- Direct metal laser sintering (DMLS)
- Plaster-based 3D printing (PP)
- Photopolymer Phase Change Inkjets
- Thermal Phase Change Inkjets
- Laminated object manufacturing (LOM)

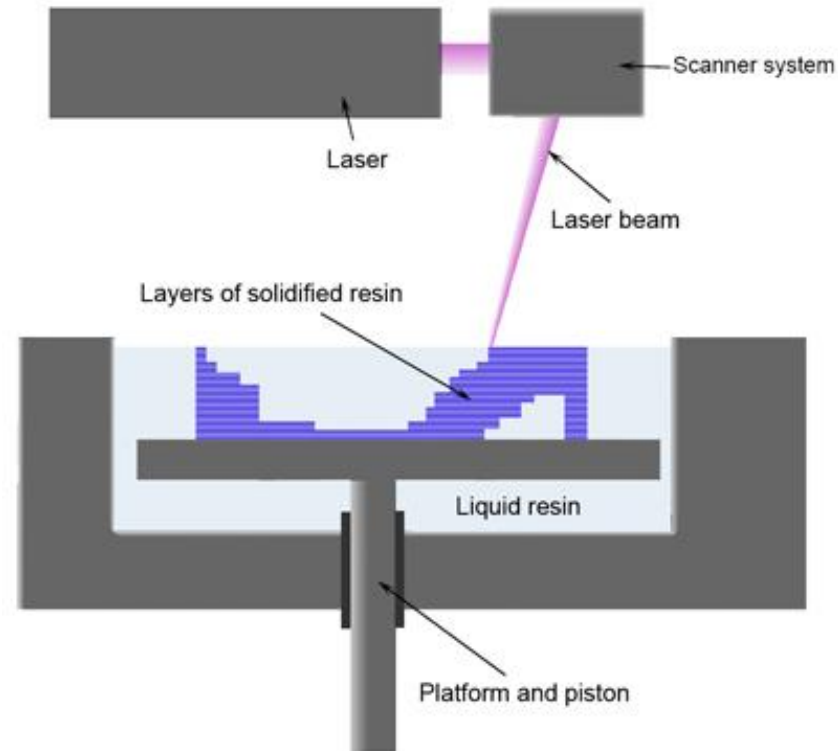

Fused Deposition Modeling (FDM)

- Filament is made of thermoplastic materials
 - e..g., ABS, polycarbonate, PLA
- Temporary support structure can be made from water-soluble material such as PVA
 - removed using heated sodium hydroxide solution

Stereolithography (SLA)

- SLA uses liquid ultraviolet curable photopolymer resin
- Laser beam traces one layer on the surface of the resin
- Laser light cures and solidifies the layer
- The platform descends by one layer

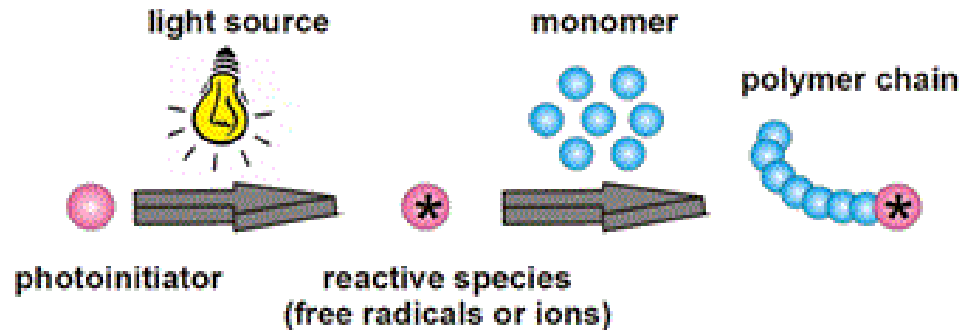

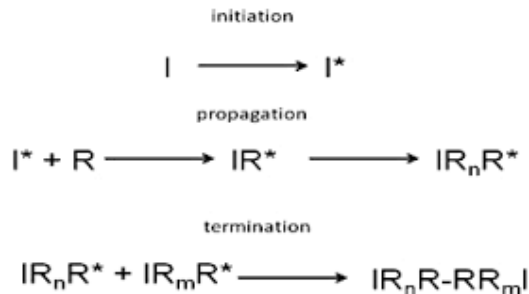

Photopolymers

- Change from a liquid state to solid state when exposed with light of a certain wavelength
- Typical ingredients:
 - **Monomers:** small molecules, lower viscosity
 - **Oligomers:** relatively high molecular weight, Acrylates, epoxies, etc.
 - **Photoinitiators:** generate reactive species (free radicals, irons) under light exposure to initiate the polymerization
 - **Additives:** binders, surfactants, stabilizers, etc.

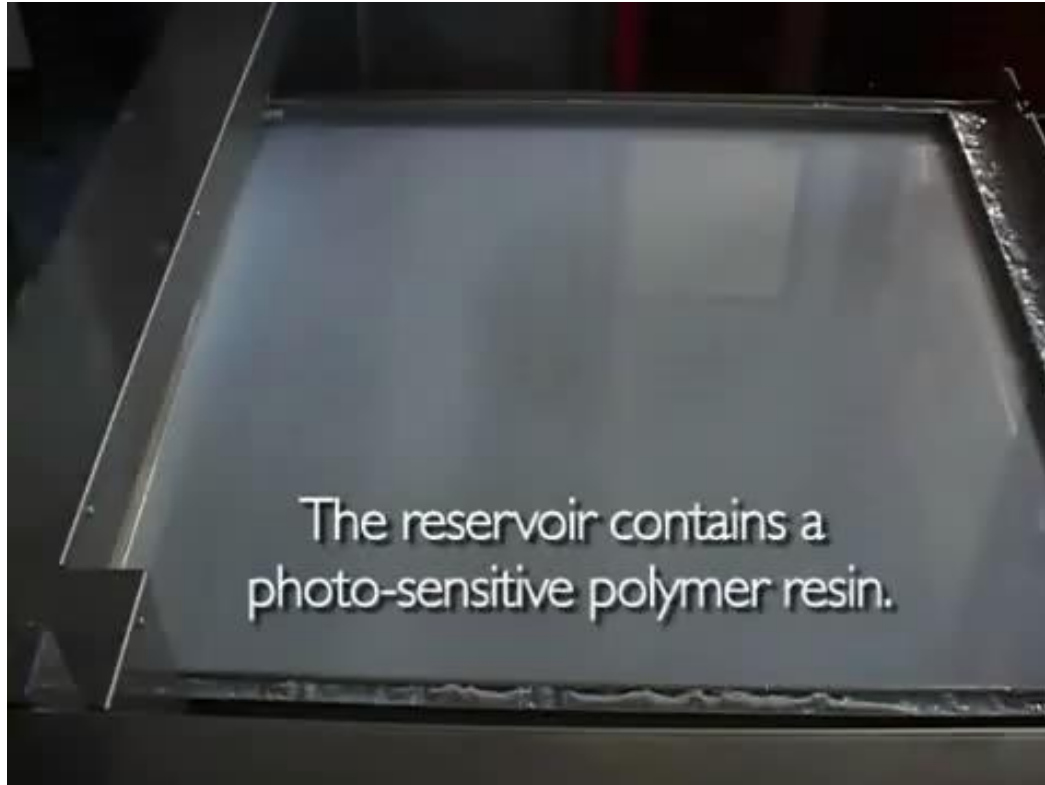

How Photopolymers Work

- Free Radical Polymerization

- **Initiation:** Free radicals are generated through the initiator when exposed to light
- **Propagation:** Free radicals react with monomer molecules to generate new reactive center, monomers react with reactive center repetitively to grow into a long chain
- **Termination:** Chain termination occurs when two reactive centers come close and react with each other to yield complete macromolecules

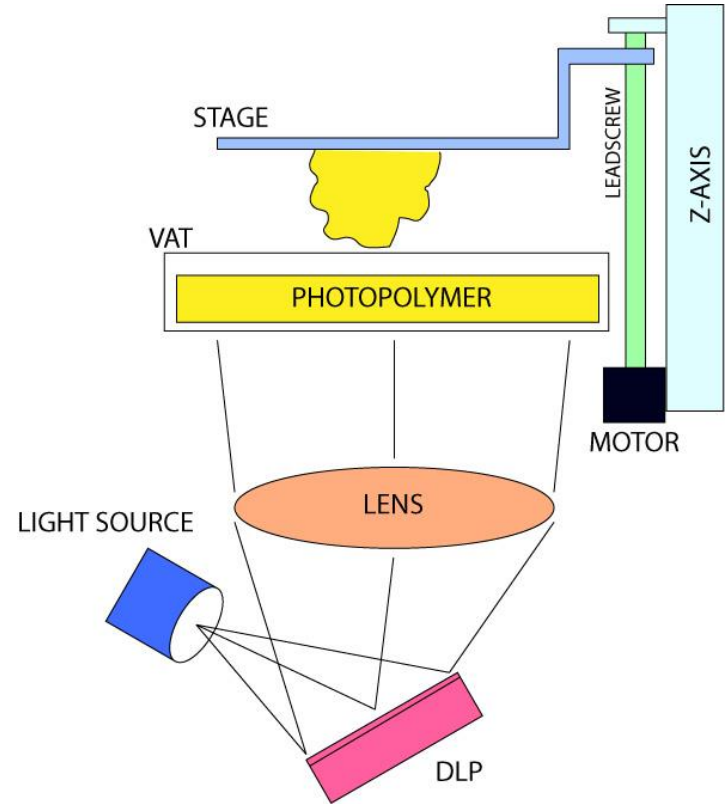

Stereolithography Process

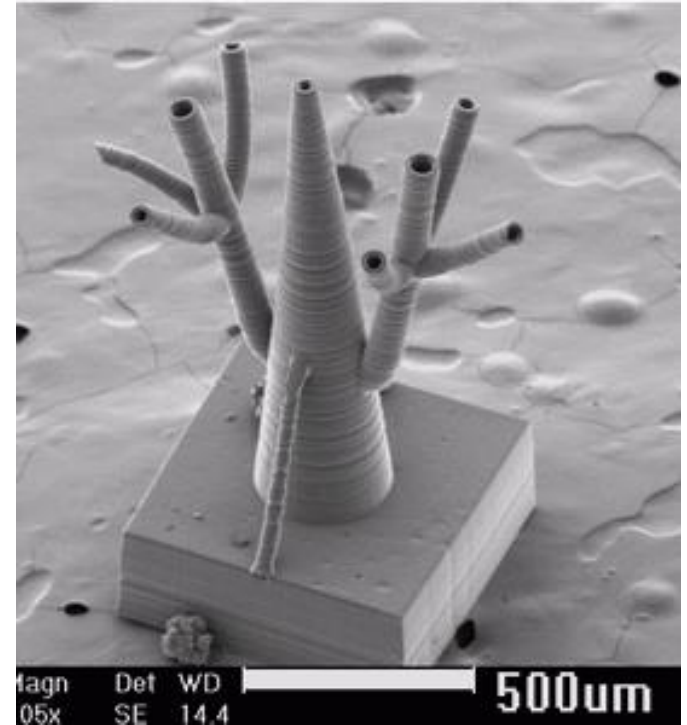

Digital Light Projector (DLP) 3D Printing

- DLP 3D printer uses liquid ultraviolet curable photopolymer resin
- DLP exposes and solidifies one layer at a time on the surface of the resin
- The Z-axis moves by one layer

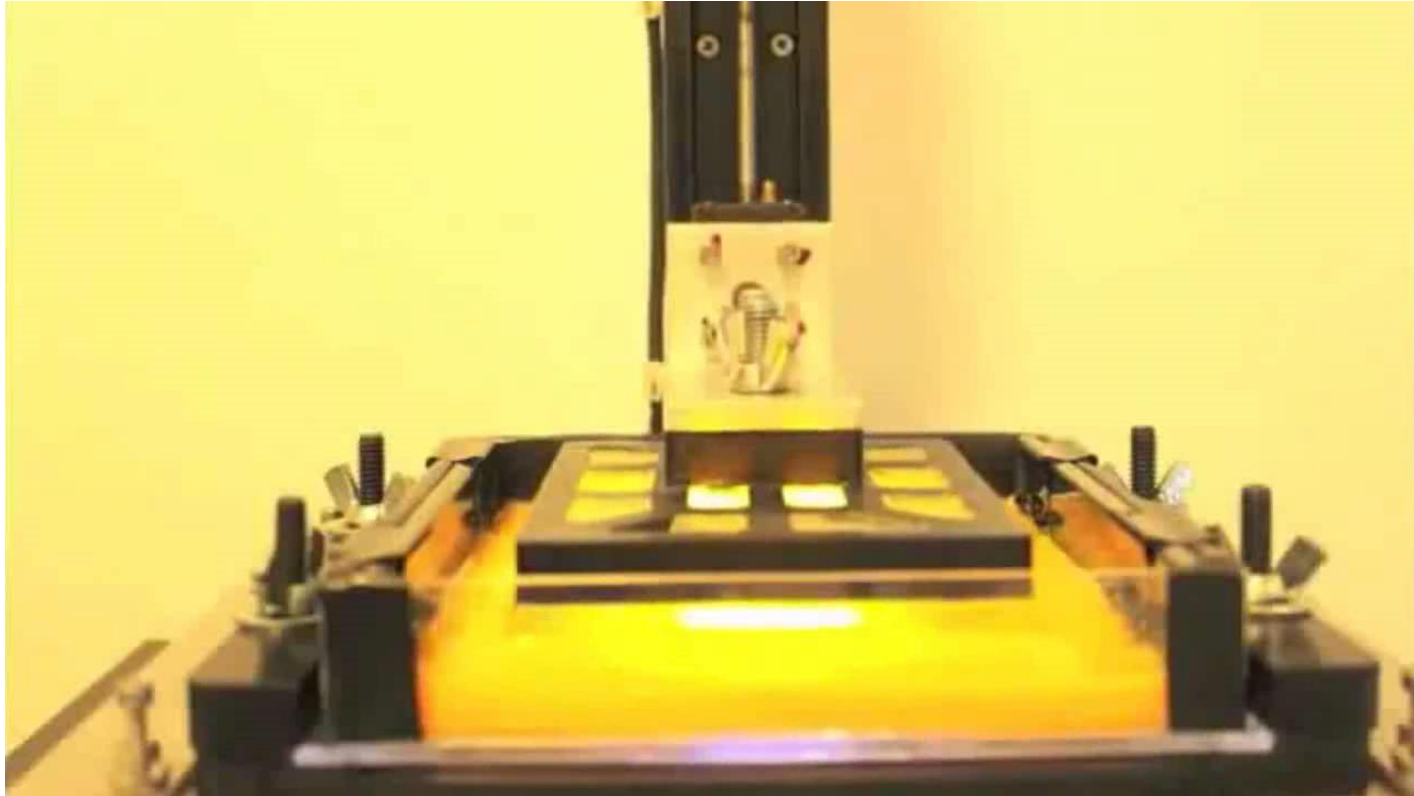

DLP 3D Printing Features

- Simple design
 - laser+mirror are replaced by a projector
 - only one degree of freedom
- Faster than SLA
 - exposes one layer at a time
- Materials
 - The same as SLA
- No additional support material
 - Lattice structure similar to SLA

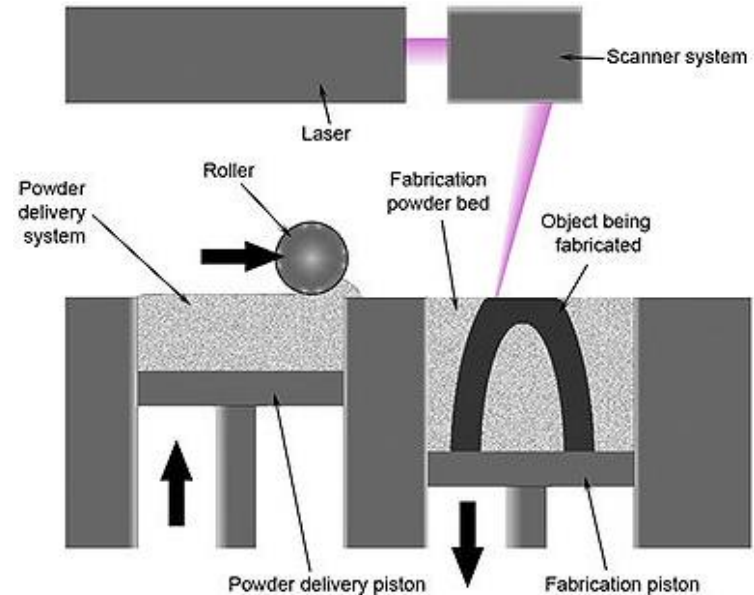

DLP 3D Printing Process

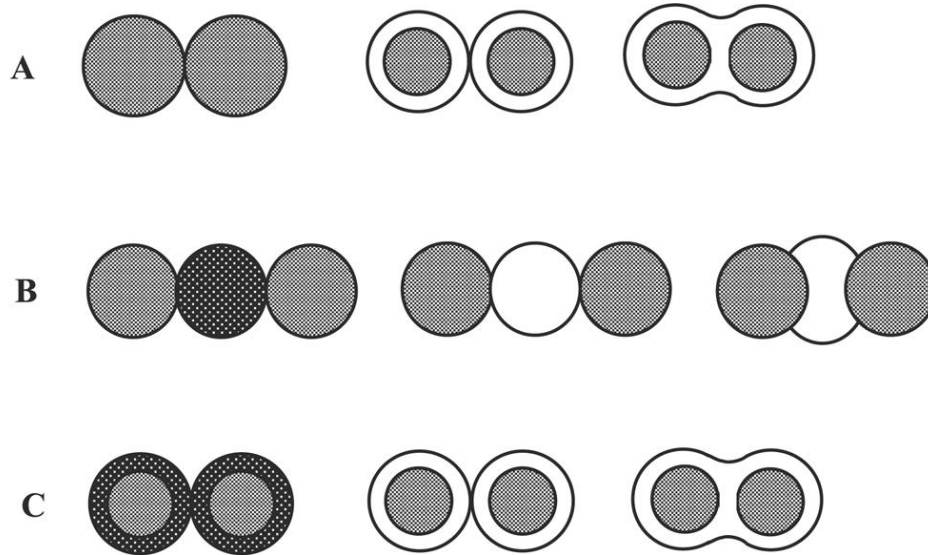

Selective Laser Sintering (SLS)

Direct Metal Laser Sintering (DMLS)

- SLS and DMLS use a bed of small particles (made of plastic, metal, ceramic, or glass)
- High-power laser traces one layer on the surface of the powder bed melting/fusing the particles
- The platform descends by one layer and more material is added

Single- and Two-Component Powders

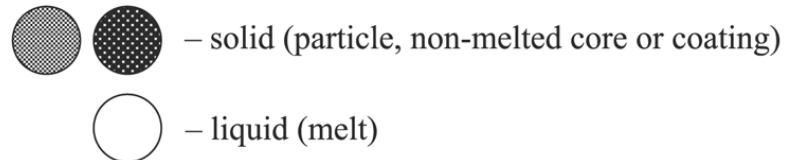

A – single-component metal powder

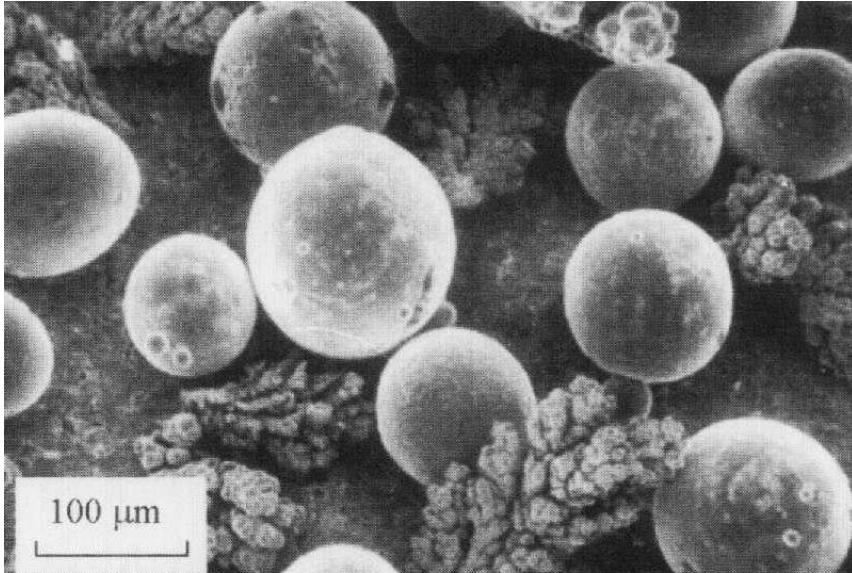

B – two-component metal/metal powder mixer

C – two-component metal/metal coated powder

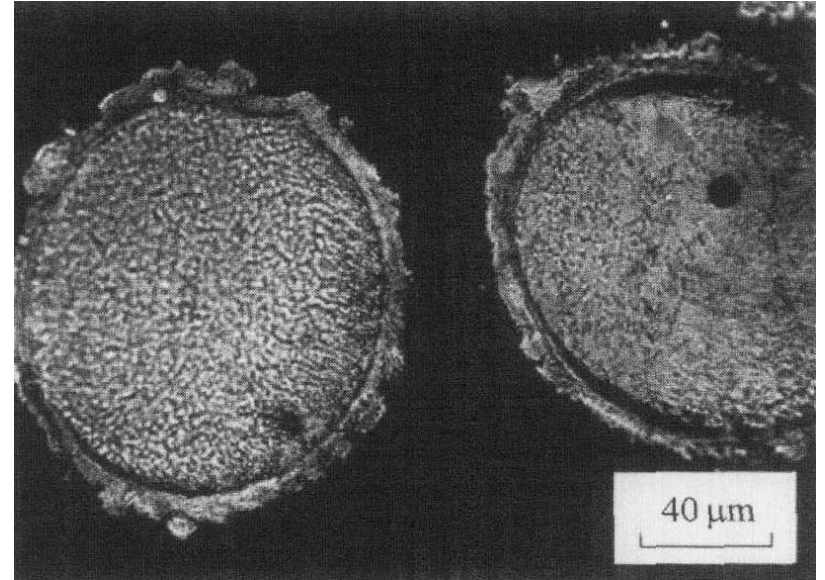

Key

Raw Powder Particles

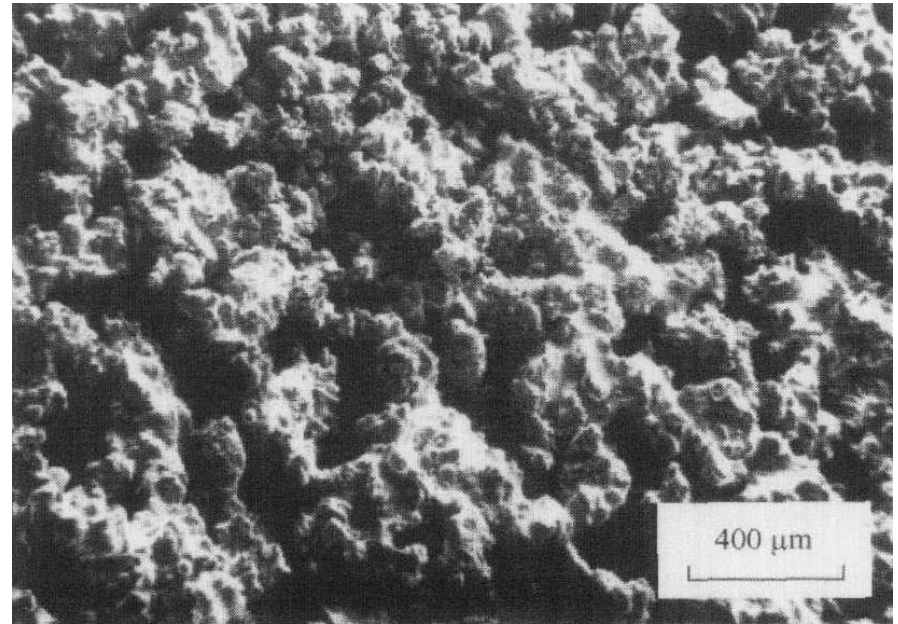

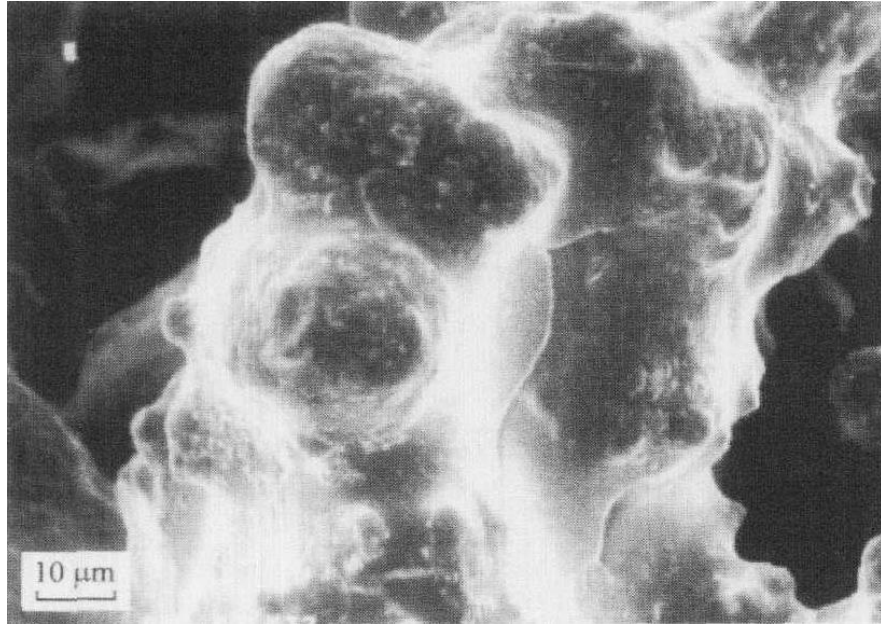

Raw Ni-alloy-Cu powder mixture

Raw Cu-coated Ni-alloy powder

Sintered Materials

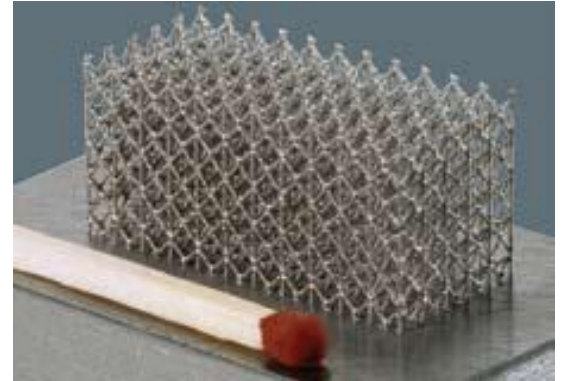

Fe-Cu powder mixture **after** sintering

SLS & DMLS Process

Sample Fabricated Parts

Sources: <http://www.bridgesmathart.org> , <http://www.freedomofcreation.com>

Plaster-based 3D Printing

- This method uses a bed of small plaster particles
- Inkjet printhead prints with liquid (possibly colored) adhesive one layer on the surface of the powder bed fusing the particles
- The platform descends by one layer and more material is added

Plaster-based 3D Printing Features

- Similar to SLS and DMLS
 - Also uses granular materials
 - Uses inkjet printhead instead of laser
 - Glues particles instead of melting them
- Does not require support structure
 - Overhangs are supported by powder material
- The only technology supporting full-color printing
- Materials
 - Plaster only
 - Color can be applied (typically on/near the surface)

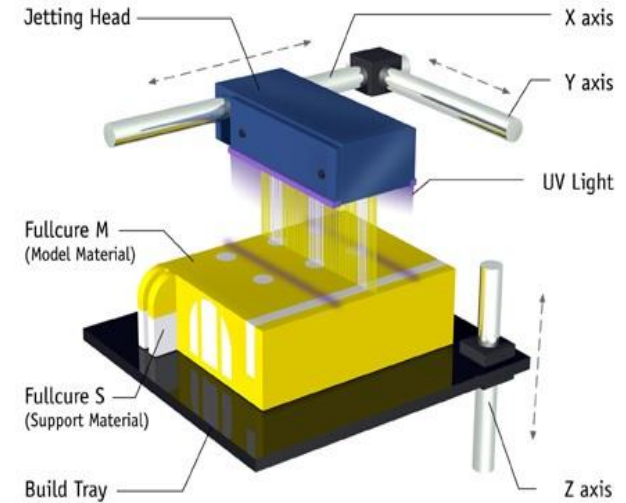

Plaster-based 3D Printing Process

Photopolymer Phase Change Inkjets

- Inkjet printhead jets liquid photopolymer and support material
- UV light cures photopolymer and support material
- Excess material is removed using a roller
- The platform descends by one layer

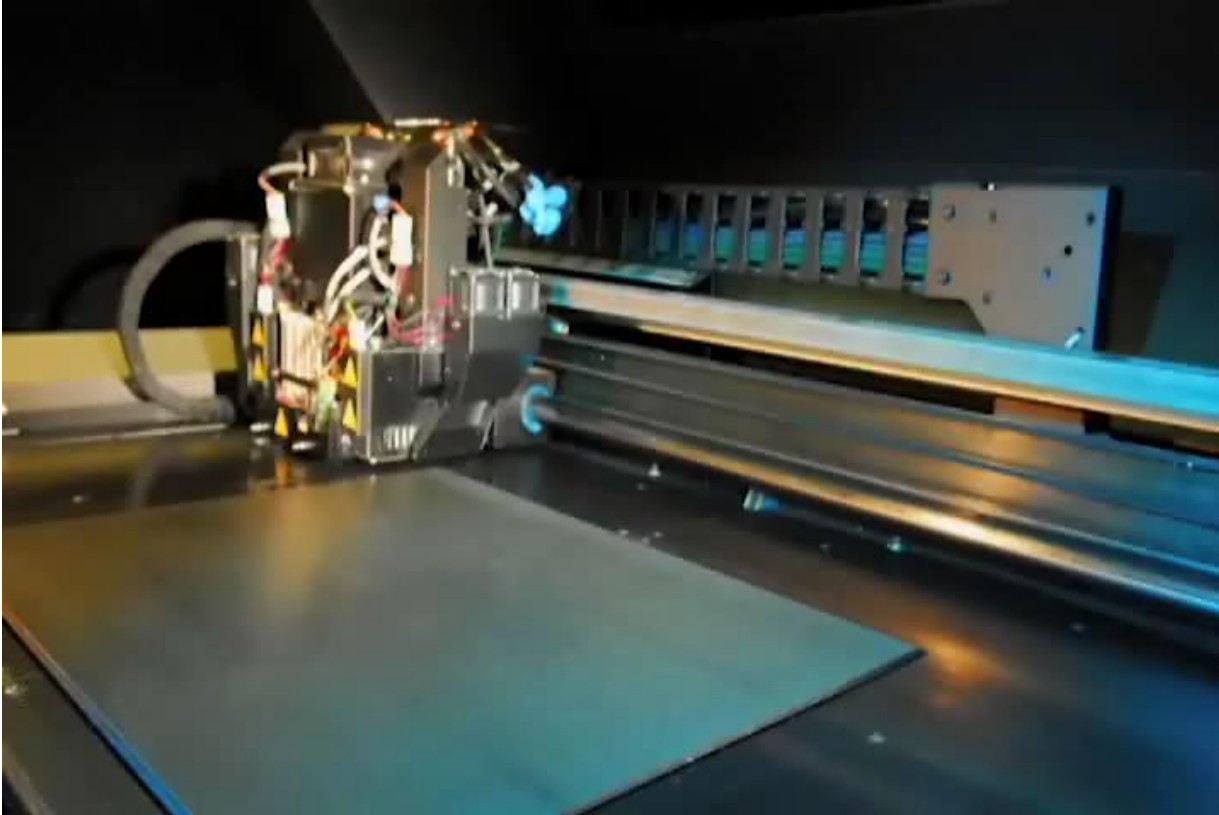

Materials

- Bio-compatible
- High-temperature
- ABS-like
- Transparent
- Opaque
- Rigid
- Polypropylene-like
- Rubber-like

Photopolymer Phase Change Inkjet 3D Printing

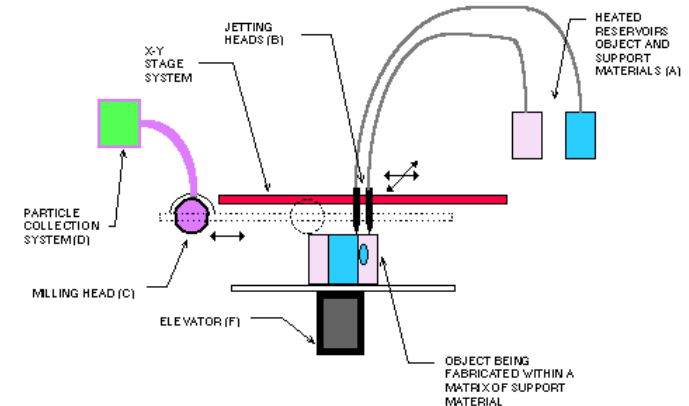

Source: <https://www.youtube.com/watch?v=XLLq9SwSTpM>

Sample Fabricated Objects

Thermal Phase Change Inkjets

- Inkjet printhead jets heated liquid plastic and support material (wax)
- Material droplets solidify as they cool down
- Excess material is removed using a milling head to make a uniform thickness layer
- Particles are vacuumed away
- The platform descends by one layer

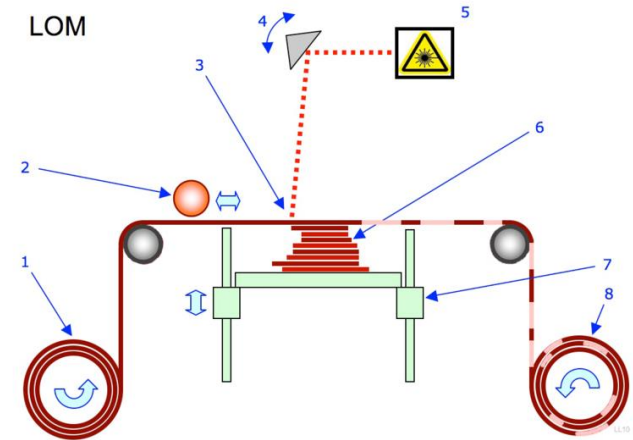

Thermal Phase Change Inkjets Features

- Extremely high resolution
- Slow printing time
- Materials
 - Limited: plastics and waxes
- Support material
 - Wax: easy to remove
- Manufactured objects are used as casting pattern but almost never as final functional parts

Laminated Object Manufacturing (LOM)

- Sheet is adhered to a substrate with a heated roller
- Laser traces desired dimensions of prototype
- Laser cross hatches non-part area to facilitate waste removal
- Platform with completed layer moves down out of the way
- Fresh sheet of material is rolled into position
- Platform moves up into position to receive next layer

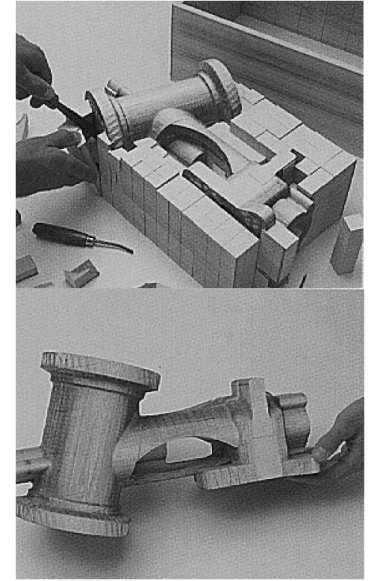

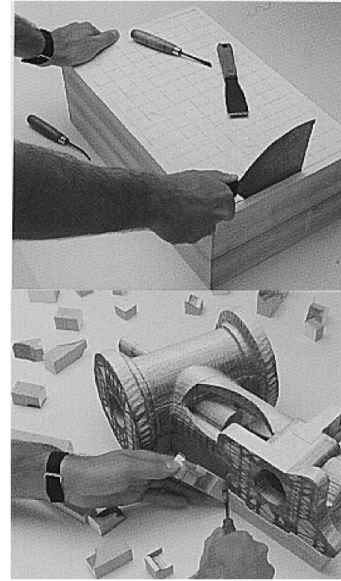

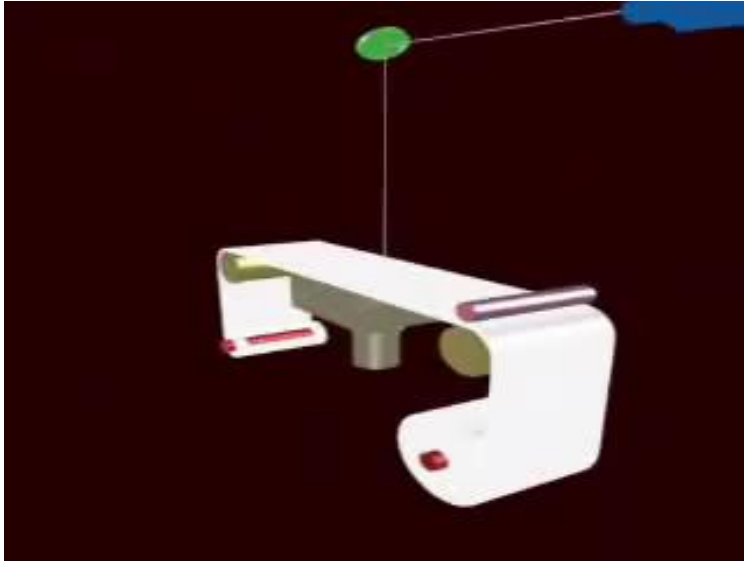

1 Foil supply. 2 Heated roller. 3 Laser beam. 4. Scanning prism. 5 Laser unit. 6 Layers. 7 Moving platform. 8 Waste.

Laminated Object Manufacturing Features

- Inexpensive – low material cost
- Color can be added using additional printhead
- Materials
 - Paper (most common), plastics, composites
- Support material
 - The same material can be used as support

LOM Printing Process

3D Printing Software Pipeline

Model Orientation

- Model orientation on the build platform influences
 - Mechanical properties
 - Build time
 - Support volume
 - Surface accuracy
 - Support contact area

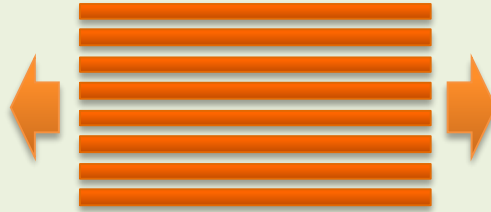

Model Orientation: Mechanical Properties

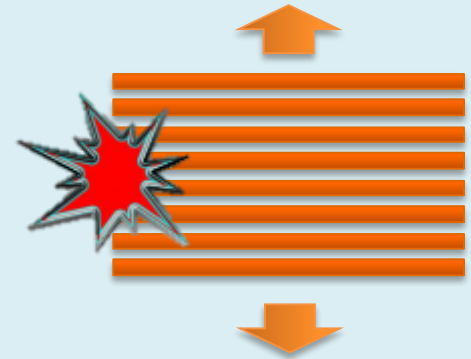

↑
printing
direction

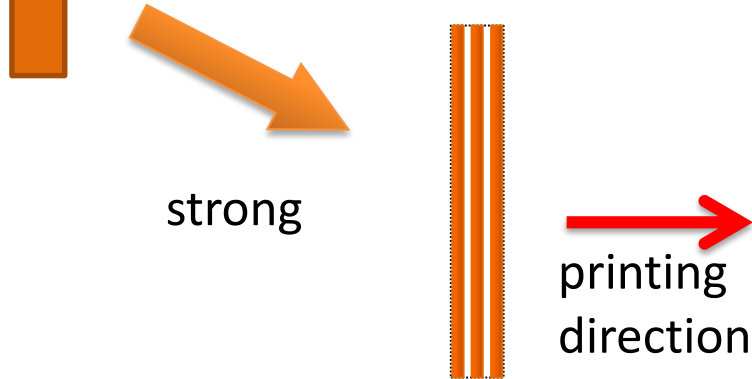

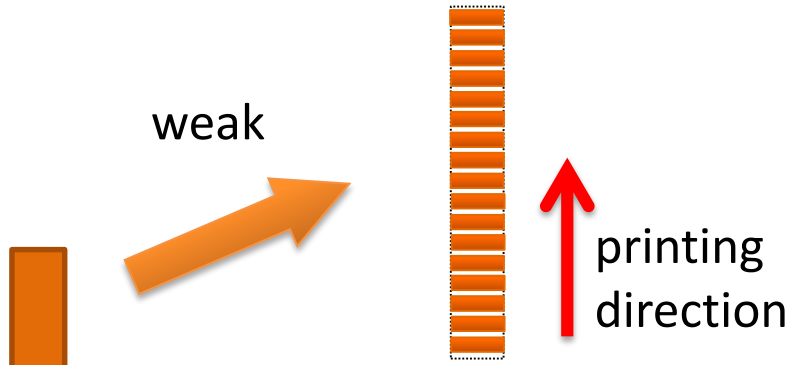

strong

weak

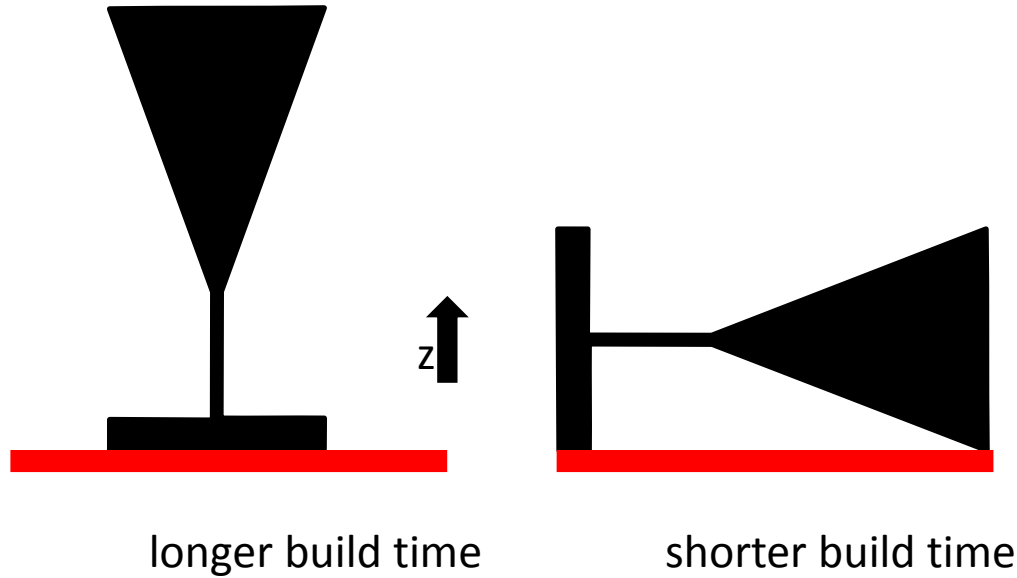

Model Orientation: Mechanical Properties

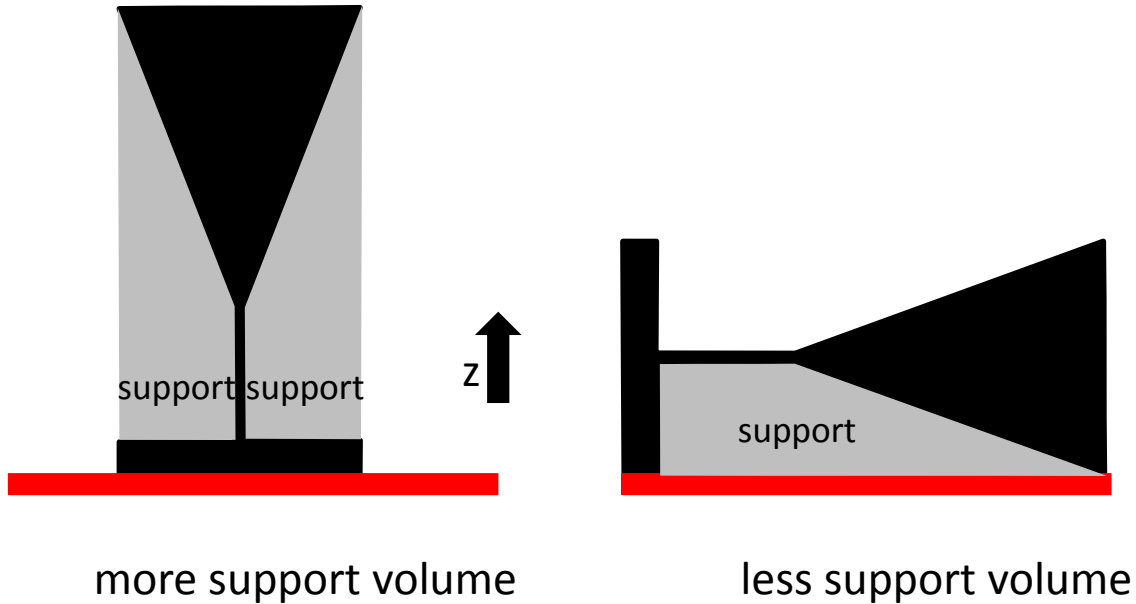

Model Orientation: Build Time

- Build speed is slower for the z direction compared to the xy direction

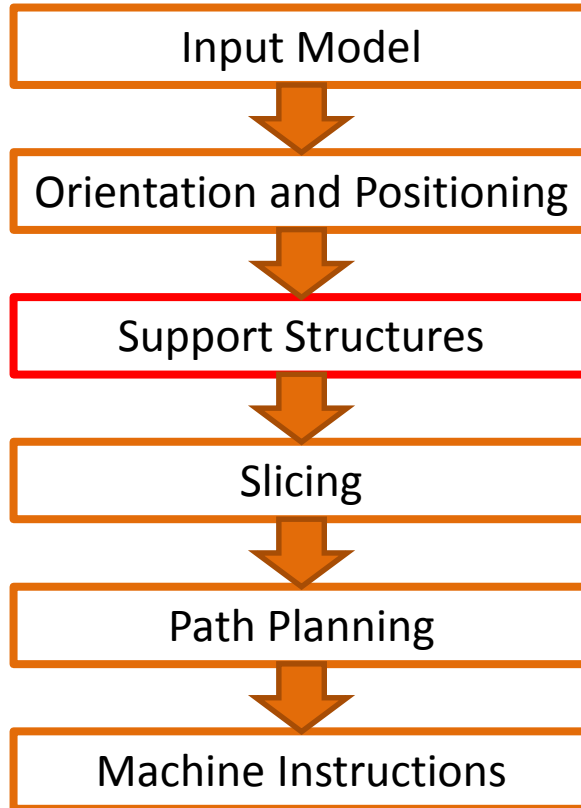

Model Orientation: Support Volume

Algorithms for Specifying Model Orientation

- Manual placement
 - User is responsible for placing parts on the build tray
- Semi-automated placement
 - User places parts on the build tray
 - System provides feedback on build time, support volume, support contact area, mechanical properties
- Automated placement
 - orientation is computed using optimization according to one or more objectives (build time, support volume, support area, mechanical properties)

3D Printing Software Pipeline

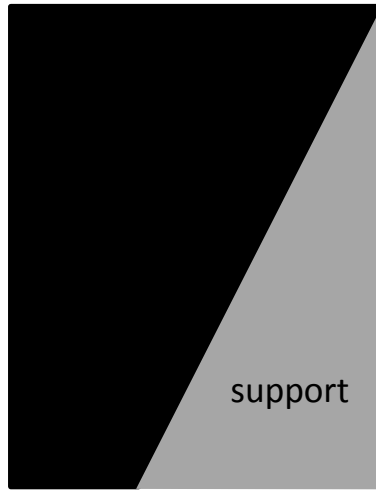

Support Structure Generation

- Do not require special support
 - SLS, DMLS, LOM, Plaster-based
- Require support
 - SLA, DLP, FDM, phase-change inkjet
- Different goals
 - Prevent curling as the resin hardens
 - Supporting overhangs
 - Maintaining stability (part does not move, tip over)
 - Supporting large flat walls
 - Preventing excessive shrinkage
 - Supporting slanted walls

Support Structure Generation Depends on Manufacturing Method

- Different for FDM, SLA/DLP, inkjet printing

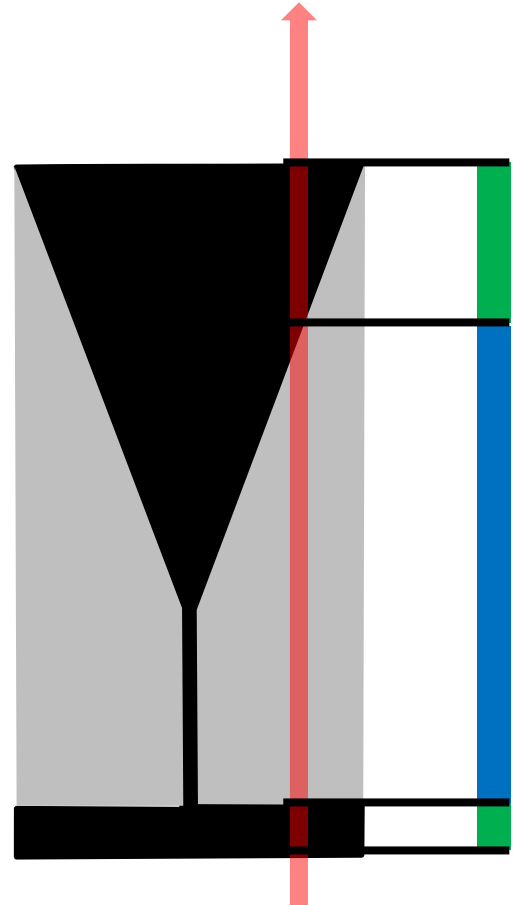

inkjet

FDM

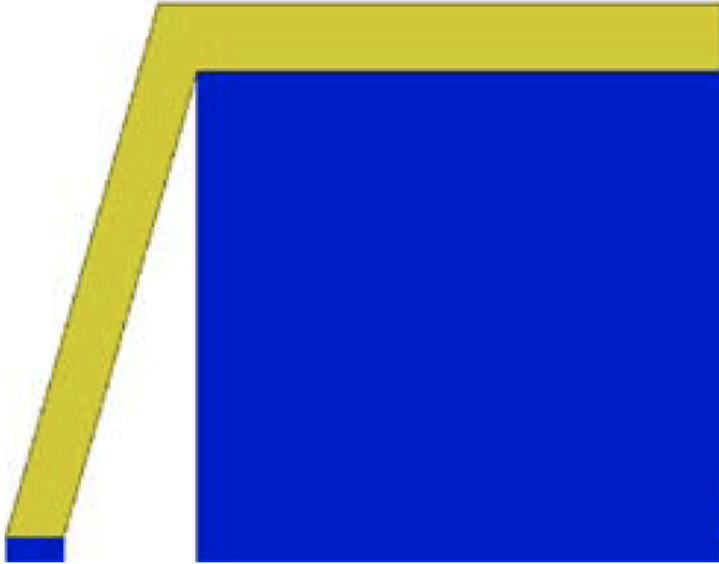

Simple Conservative Algorithm

- Use ray casting in the z direction to compute all intersections for a ray
- Sort intersections in the increasing z to determine intervals **inside/outside** of the object
- Any **outside** intervals before the last **inside** interval should contain support

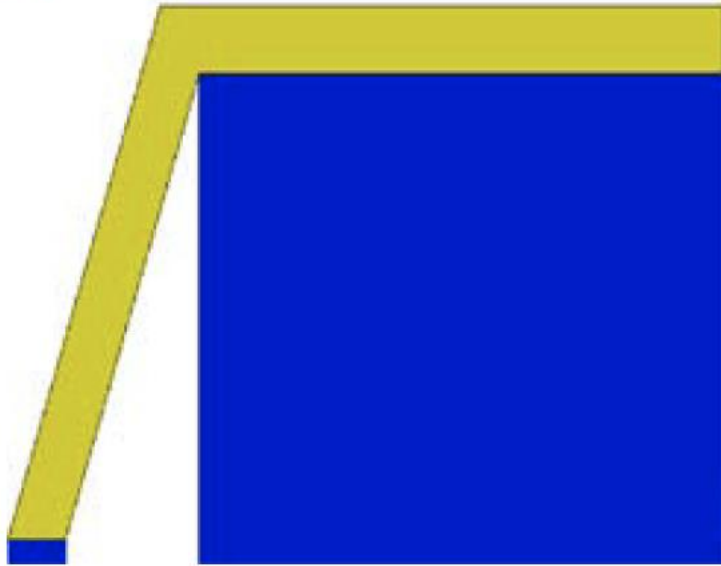

Support Generation For FDM

- FDM printers can print at some draft angle

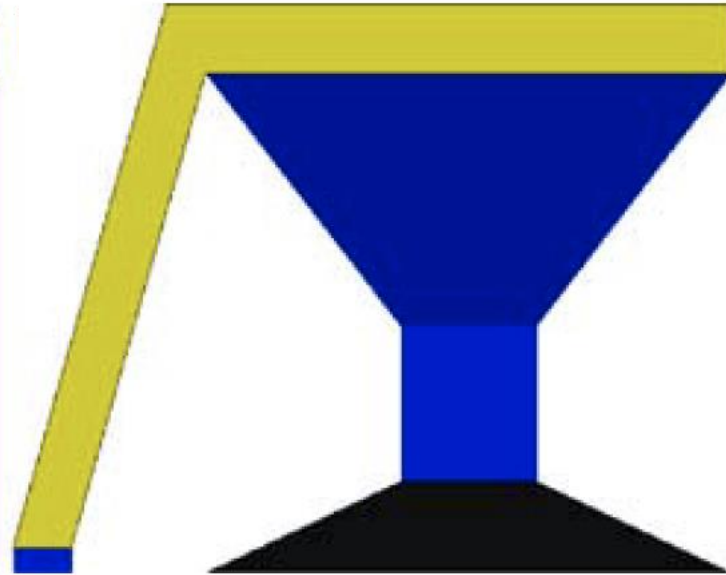

Support Generation For FDM

- Minimize the use of support material

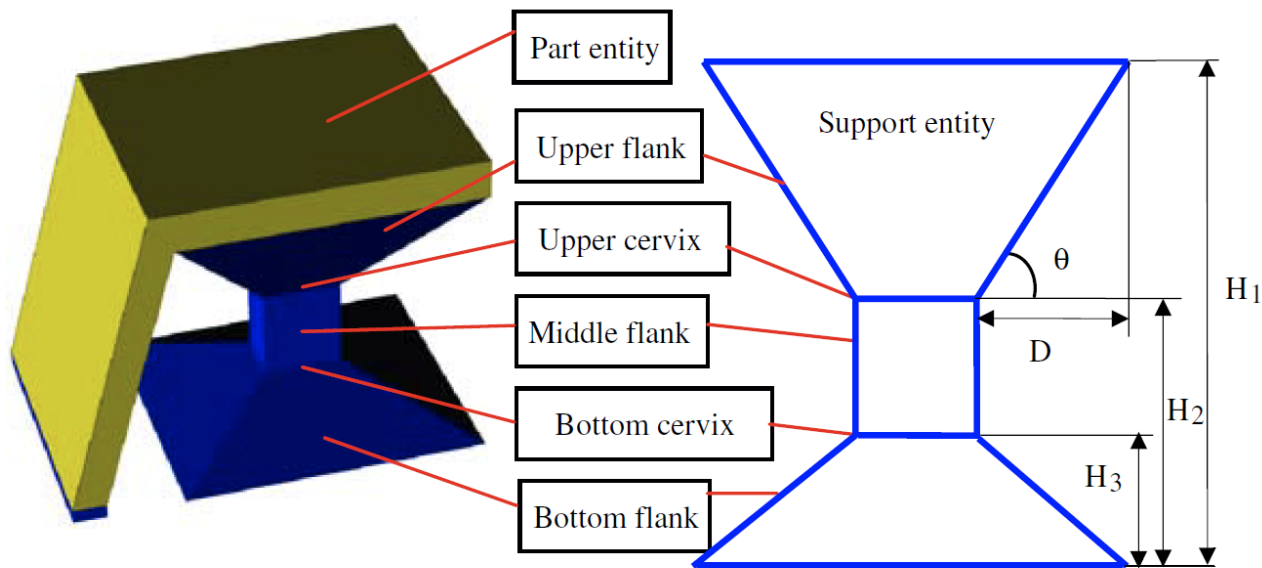

unoptimized support

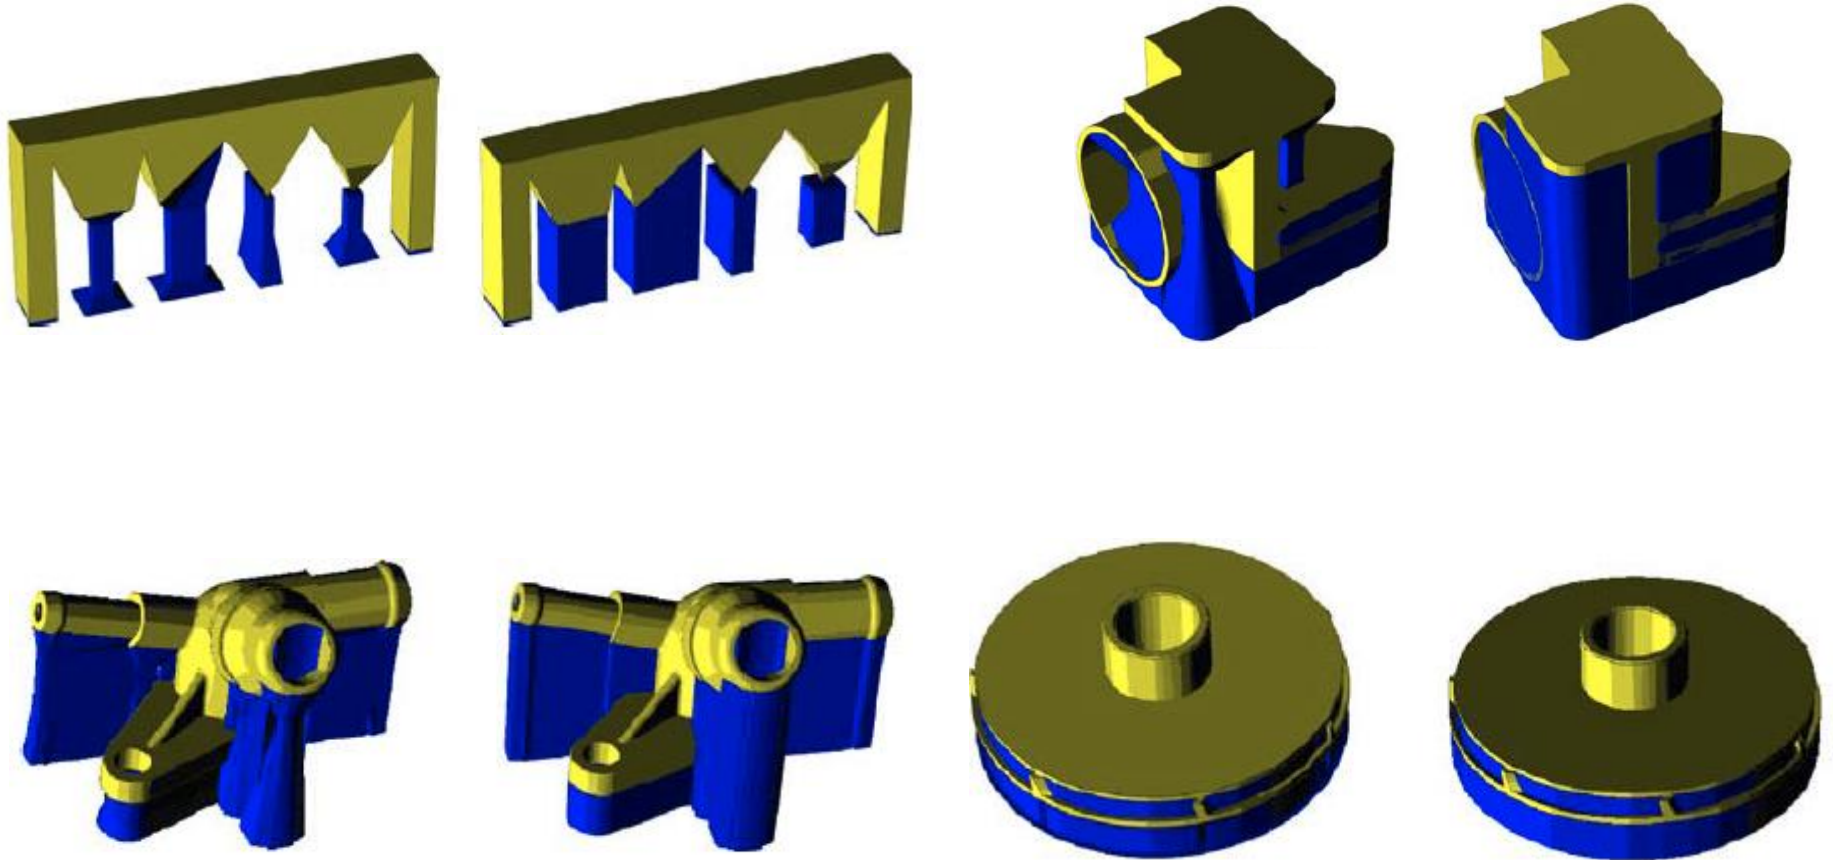

optimized support

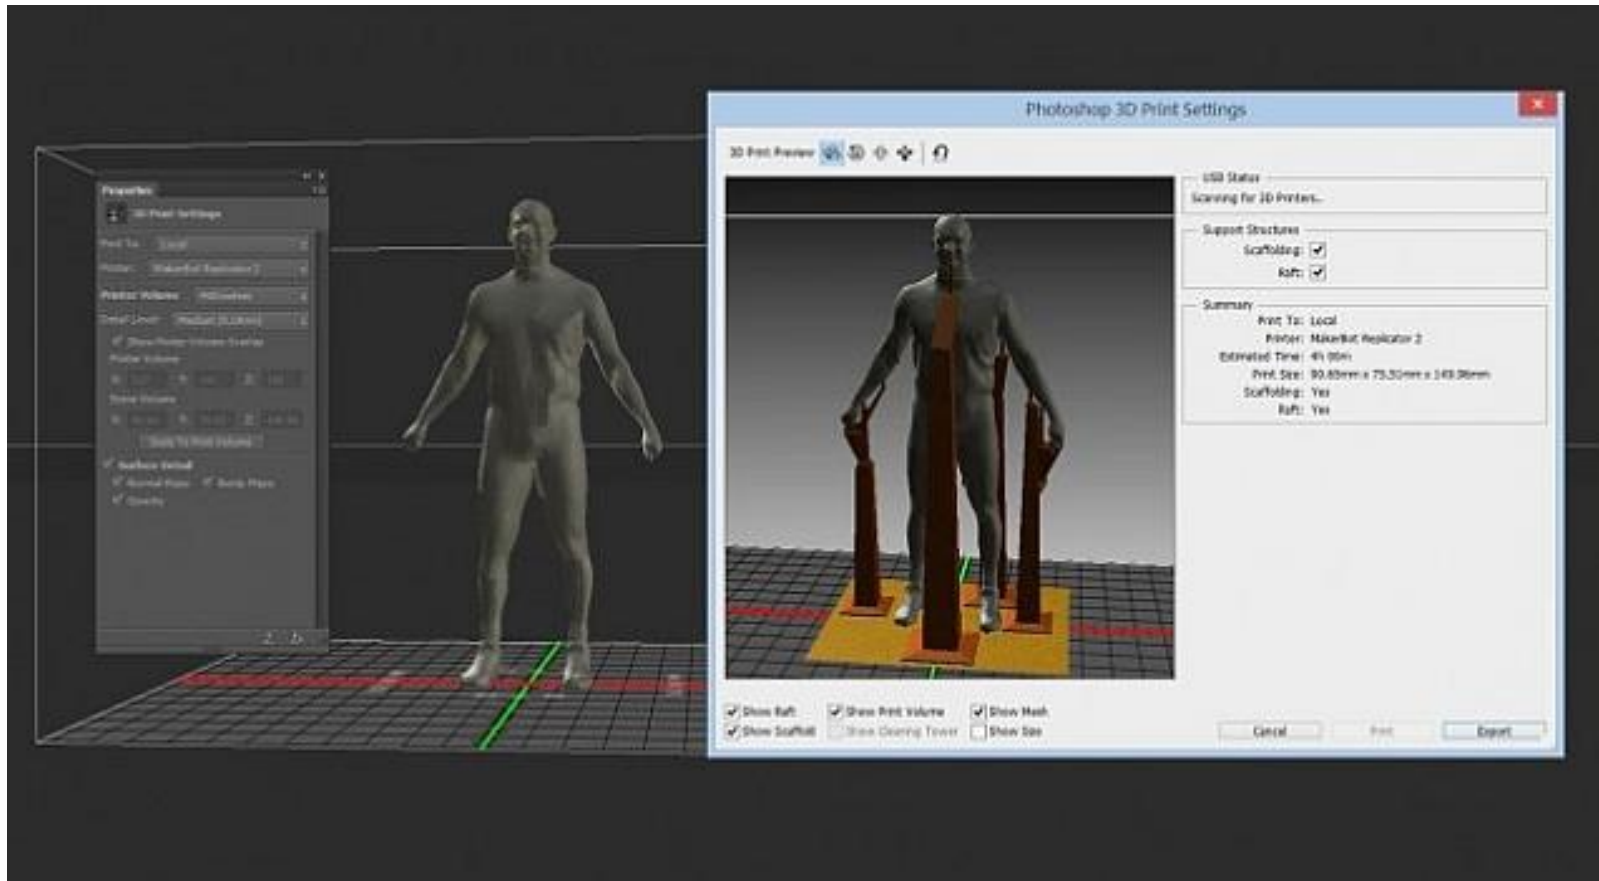

Optimized Support Structures

Unoptimized vs. Optimized Support Structure

Advanced Algorithms: Photoshop

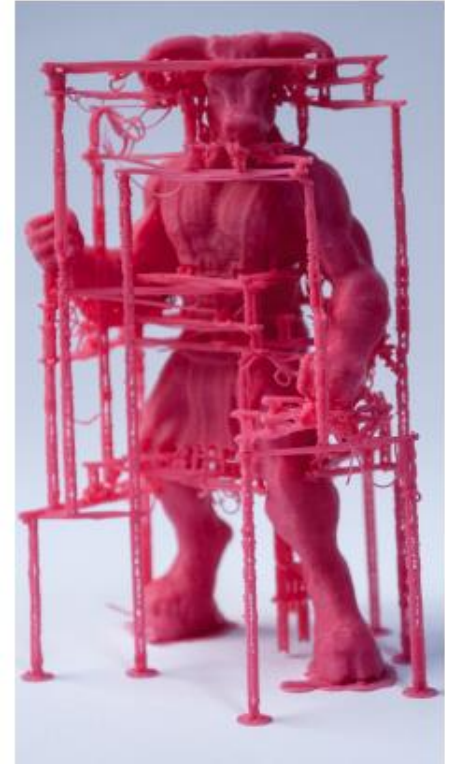

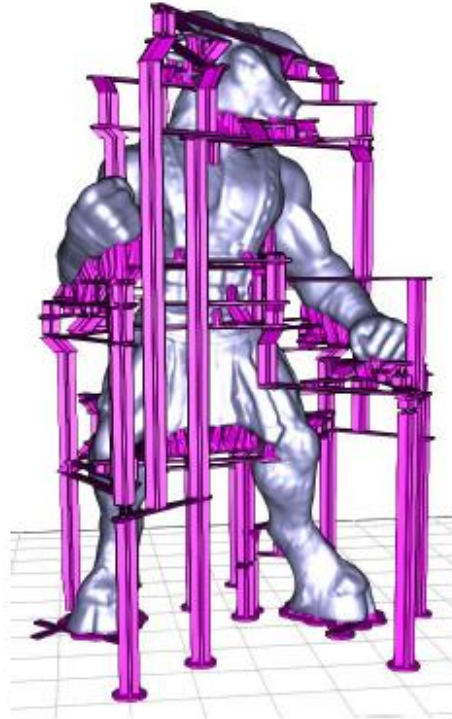

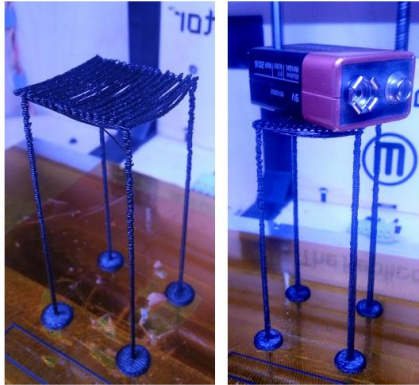

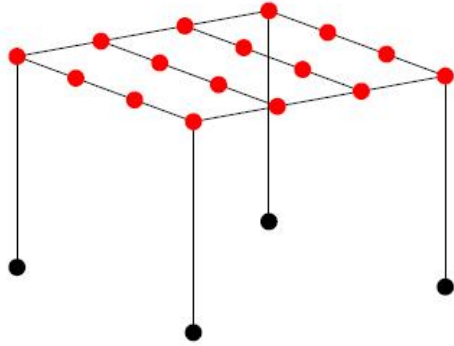

Advanced Algorithms: MeshMixer

3D Printing Software Pipeline

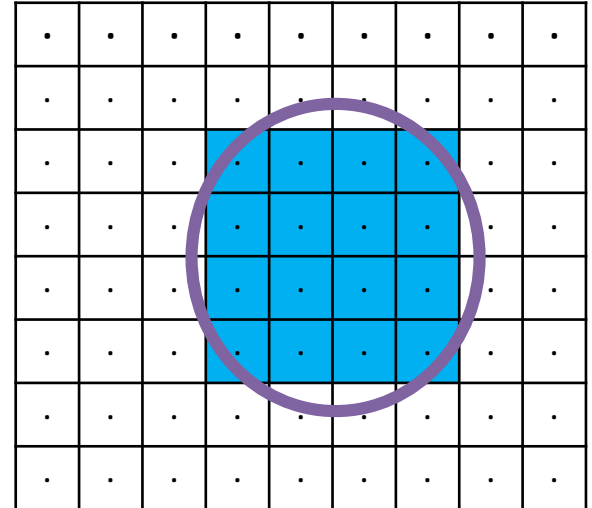

Slicing

- For a discrete z value, compute an intersection of a plane with a model

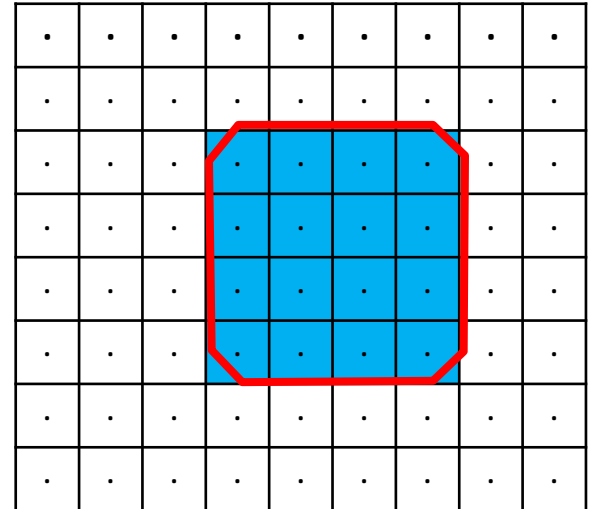

Slicing Algorithms: Voxelization

- For each voxel compute inside/outside
- Extract contours

Slicing Algorithms: Voxelization

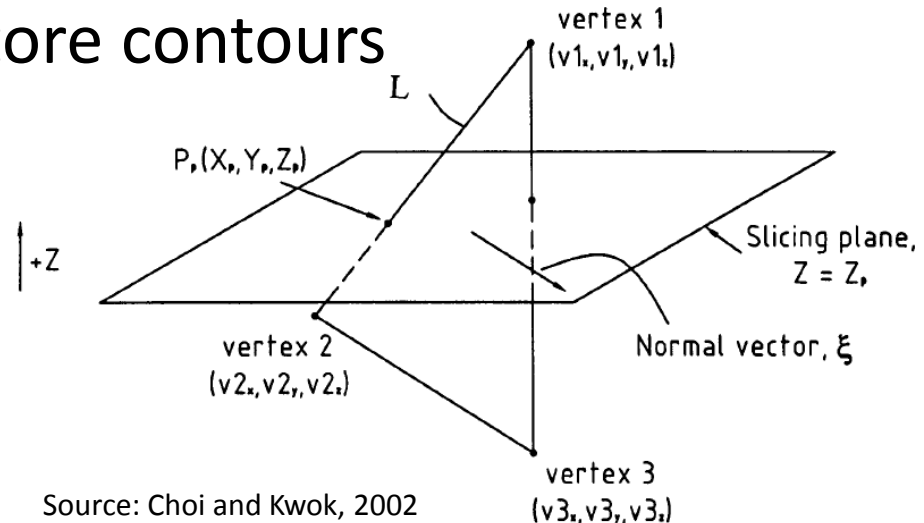

- For each voxel compute inside/outside
- **Extract contours (e.g., Marching Squares)**

Slicing Algorithms: Direct Plane-Triangle Intersection

- For each triangle
 - Intersect triangle with the z plane
 - If they intersect, store the line segment
- Connect line segments, store contours

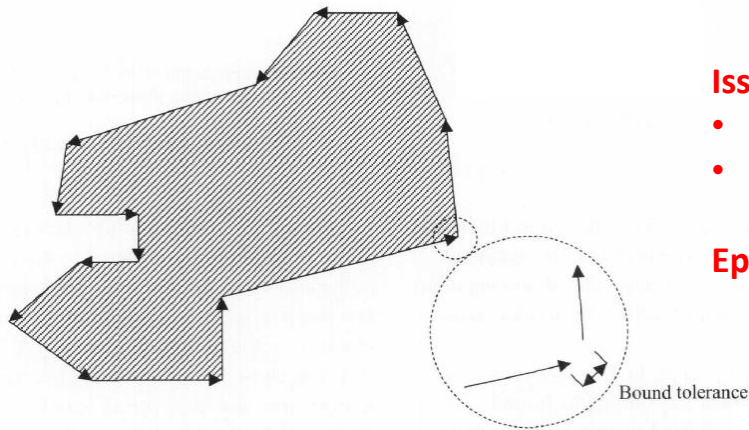

1. Intersect each edge with the plane
2. If two intersection points, connect them to form a line segment

Source: Choi and Kwok, 2002

Slicing Algorithms: Direct Plane-Triangle Intersection

- For each triangle
 - Intersect triangle with the z plane
 - If they intersect, store the line segment
- Connect line segments, store contours

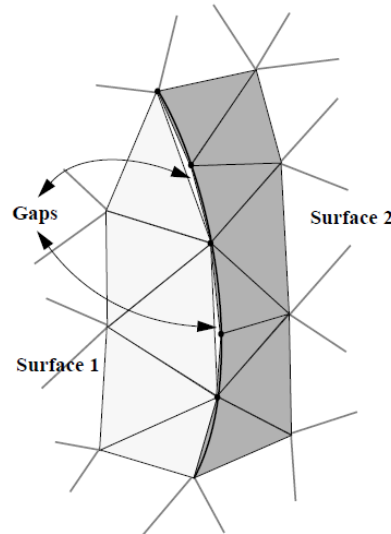

Issues

- spurious line segments
- missing line segments

Epsilons

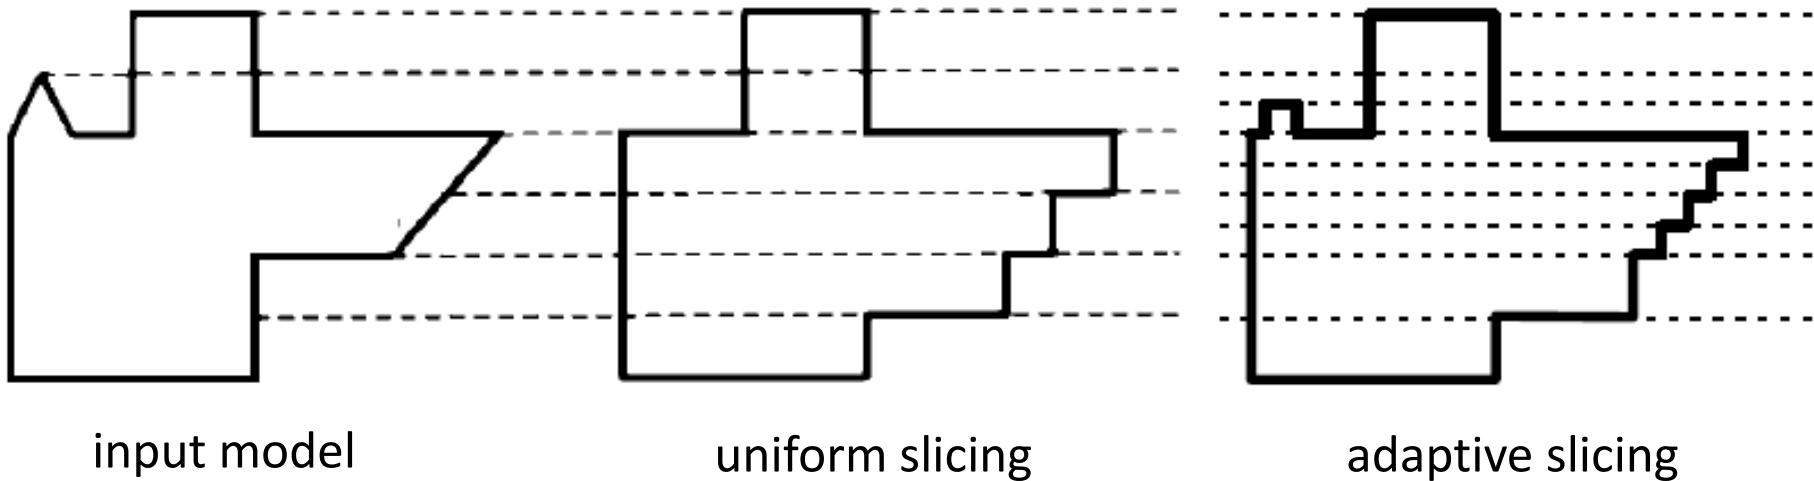

Slicing Algorithms: Direct Plane-Triangle Intersection

- STL models are not always watertight -> epsilons

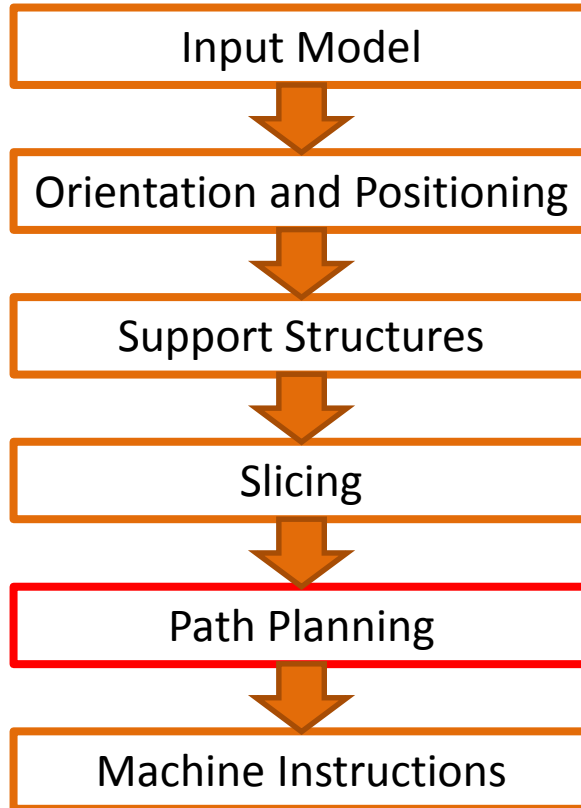

Adaptive Slicing

- Slice height is adapted to the input geometry
- Adaptive slicing is rarely used

3D Printing Software Pipeline

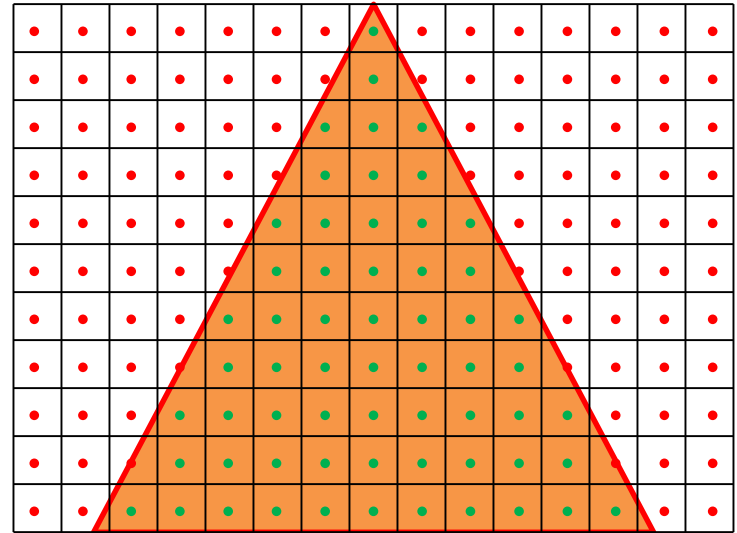

What Does Path Planning Influence?

- Build time
 - repositioning the tool at the start of a new path
 - accelerating and decelerating for direction changes
- Surface accuracy
 - the filament size
- Distortion
 - materials with a high coefficient of thermal expansion
 - the top layer shrinks when it hardens and it distorts since it is tied to the bottom layer
- Stiffness and strength
 - fill pattern
 - the area and strength of bonds depends on spacing and the time interval between the tool traversal

Path Planning for Raster-based 3D Printing

- Superimpose a voxel grid and test whether a voxel is inside/outside the model
- Trivial for DLP 3D printing
- For inkjet-based 3D printing requires computing print head movement (many nozzles, distances between nozzles)

Path Planning for Vector-based 3D Printing

- Contour
- Contour + solid interior
- Contour + interior fill pattern

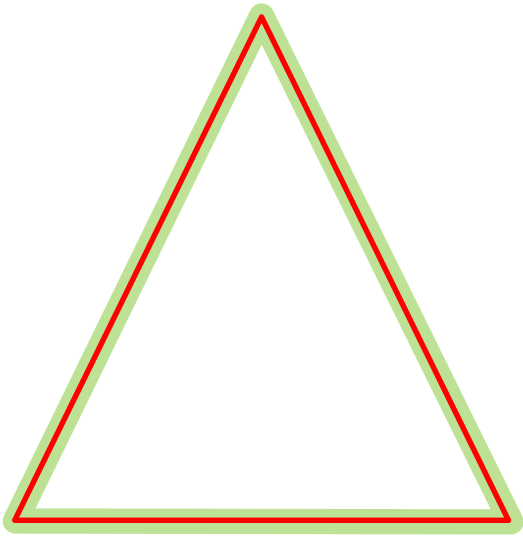

Path Planning for Vector-based 3D Printing: Contour

- Allows manufacturing hollow objects, some overhangs, some tilted surfaces
- Reduces frequency of tool repositioning
- Reduces support structures

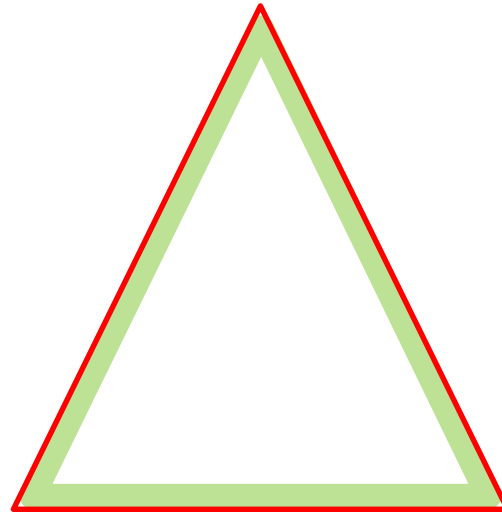

Path Planning for Vector-based 3D Printing: Contour

- Offset inwards by distance equal to the filament radius

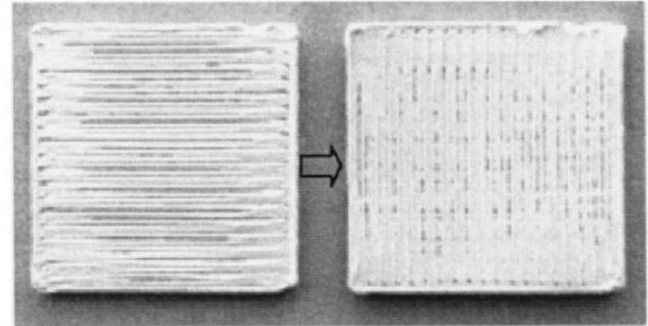

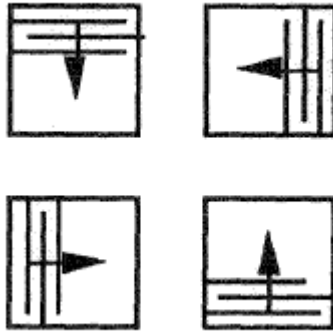

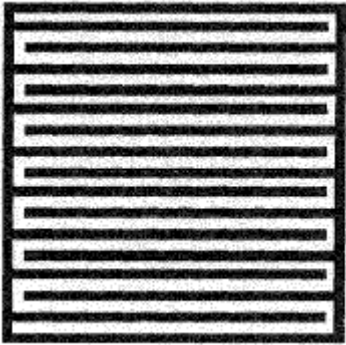

no offset

offset inwards

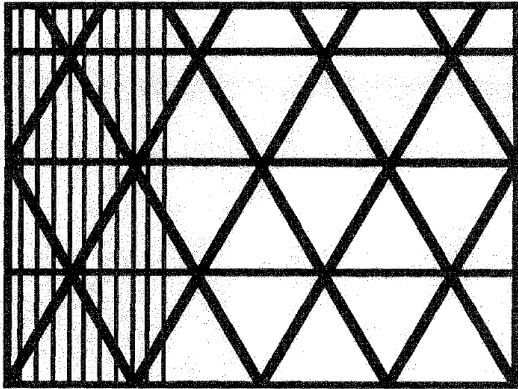

Path Planning for Vector-based 3D Printing: Interior

- Tracing contours is combined with filling the interior
- The interior can be completely filled

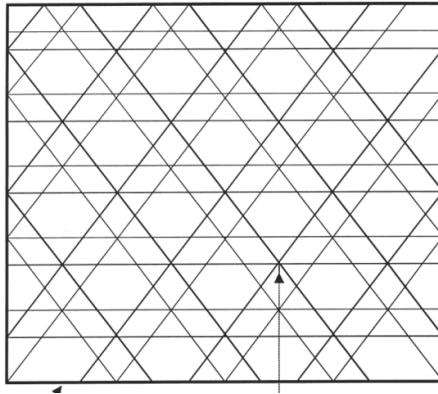

Path Planning for Vector-based 3D Printing: Interior

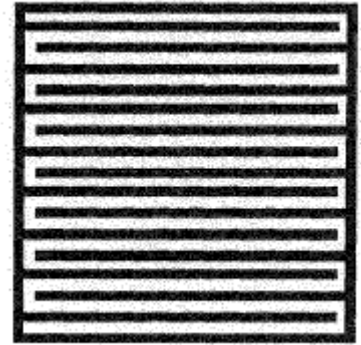

- Tracing contours is combined with filling the interior
- Many different fill patterns can be used

TriHatch

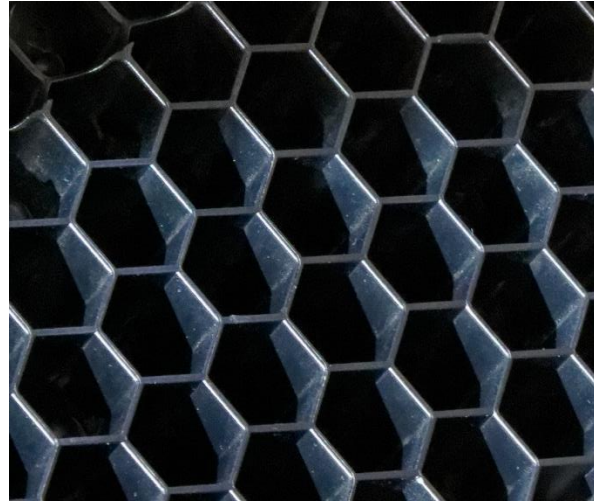

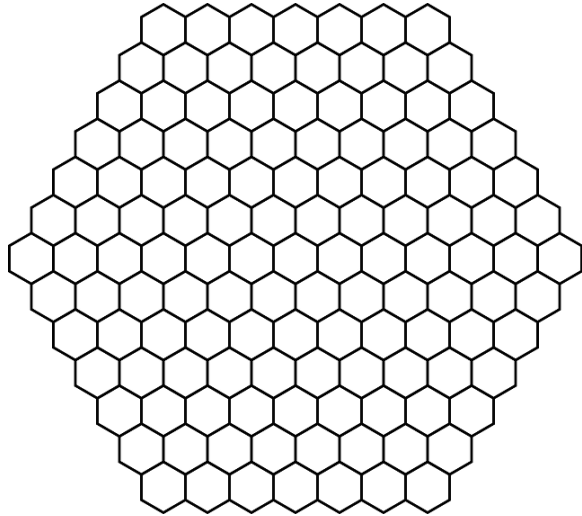

QuickCast

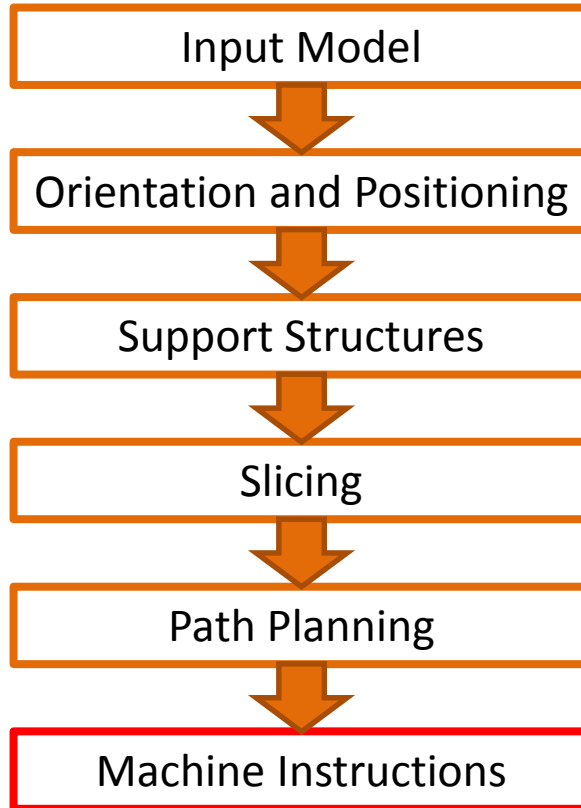

STARWEAVE

Path Planning for Vector-based 3D Printing: Interior

- A ***honeycomb-cell structure*** a good trade-off between overall weight and strength

3D Printing Software Pipeline

Machine Instructions

- Raster file formats
 - DLP 3D printing, plaster-based 3D printing, phase-change inkjets
 - Proprietary, not exposed
 - Can be exported as image files (e.g., PNG, BMP)
- Vector file formats
 - G-Code
 - SLI by 3D Systems – machine-specific 2D format for the vector commands that control the laser beam

G-code

- Numerical control (NC) programming language
- Developed at MIT in 1950s
- Used for CNC milling machines, now for many 3D printers
- Sample Instructions
 - **G00: Rapid move**
 - does not necessarily move in a single straight line between start point and end point. It moves each axis at its max speed until its vector is achieved.
 - **G01: Linear interpolation**
 - specify the start and end points, and the control automatically calculates the intermediate points to pass through that will yield a straight line
 - **G02: Circular interpolation, clockwise**

G-code Example

```
G17 G20 G90 G94 G54  
G0 Z0.25  
X-0.5 Y0.  
Z0.1  
G01 Z0. F5.  
G02 X0. Y0.5 I0.5 J0. F2.5  
X0.5 Y0. I0. J-0.5  
X0. Y-0.5 I-0.5 J0.  
X-0.5 Y0. I0. J0.5  
G01 Z0.1 F5.  
G00 X0. Y0. Z0.25
```

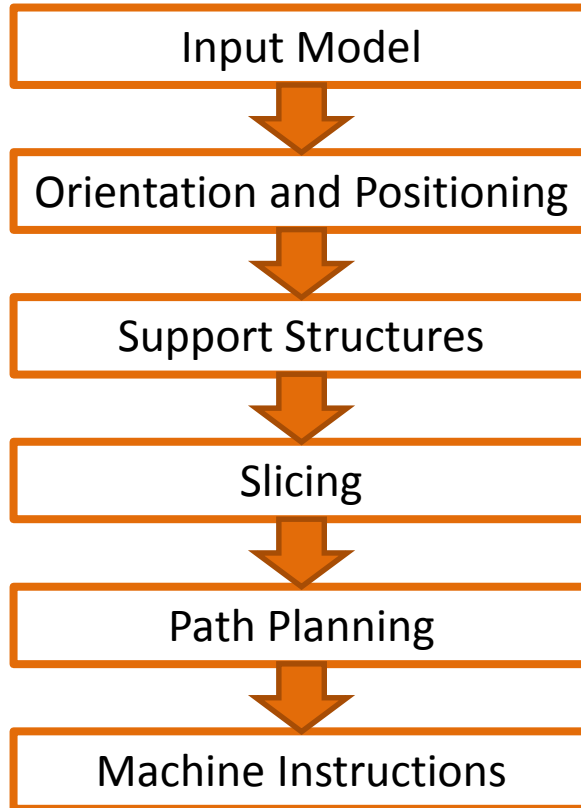

This program draws a 1" diameter circle about the origin in the X-Y plane.

seek the Z-axis to 0.25"
travel to X=-0.5 and Y=0.0

lower back to Z=0.0.
draw a clockwise circle at a slow feed rate.

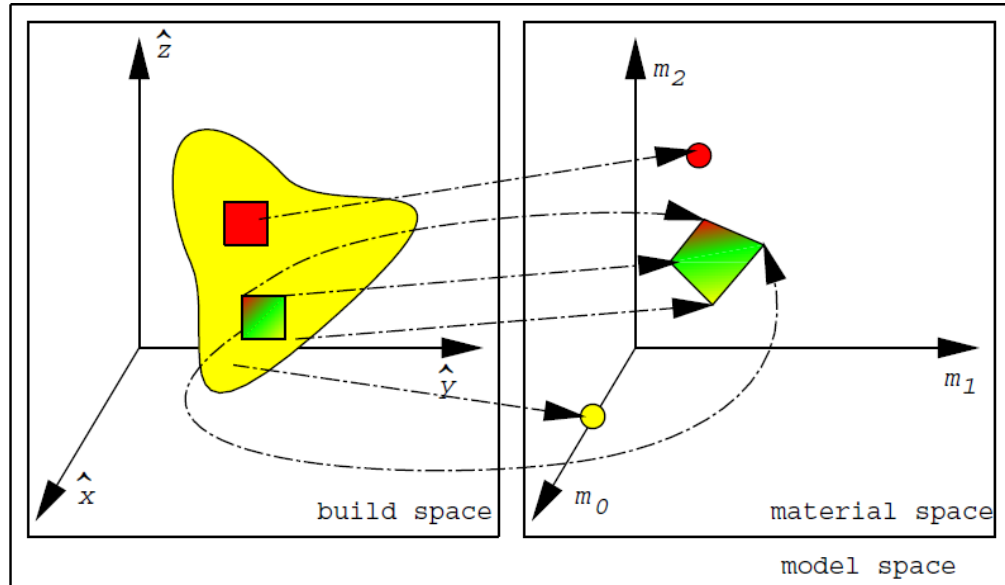

lift the Z-axis up 0.1"
seek back to X=0.0, Y=0.0, and Z=0.25

3D Printing Software Pipeline

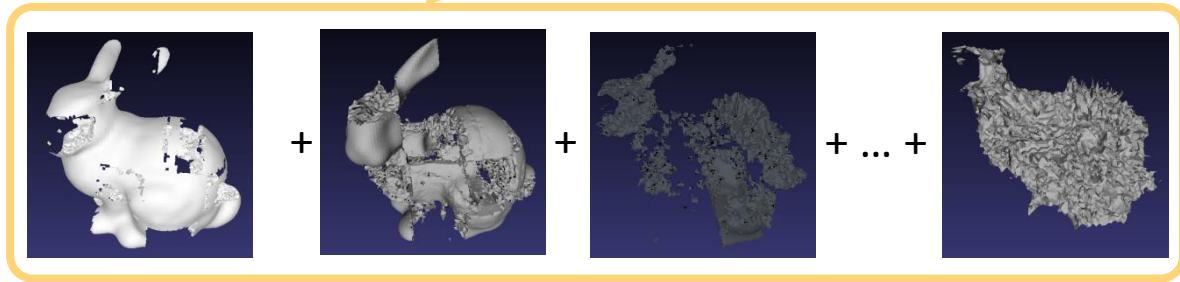

Representation of Multi-material Objects

- Each point in the Build Space ($\mathbf{x} \in \mathbf{X}$) must map to a composition in the Material Space ($\mathbf{m}(\mathbf{x}) \in \mathbf{M}$)

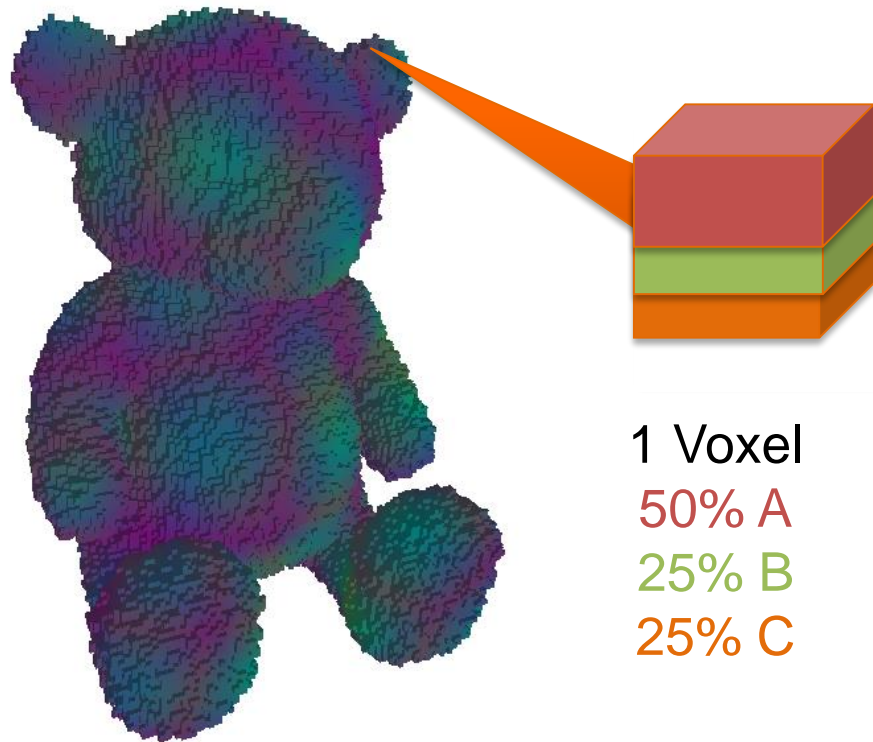

Basic Multi-Material 3D Printing Software Pipeline

- Input
 - A separate boundary representation for each material (e.g. an STL file)
- The rest of the pipeline is similar

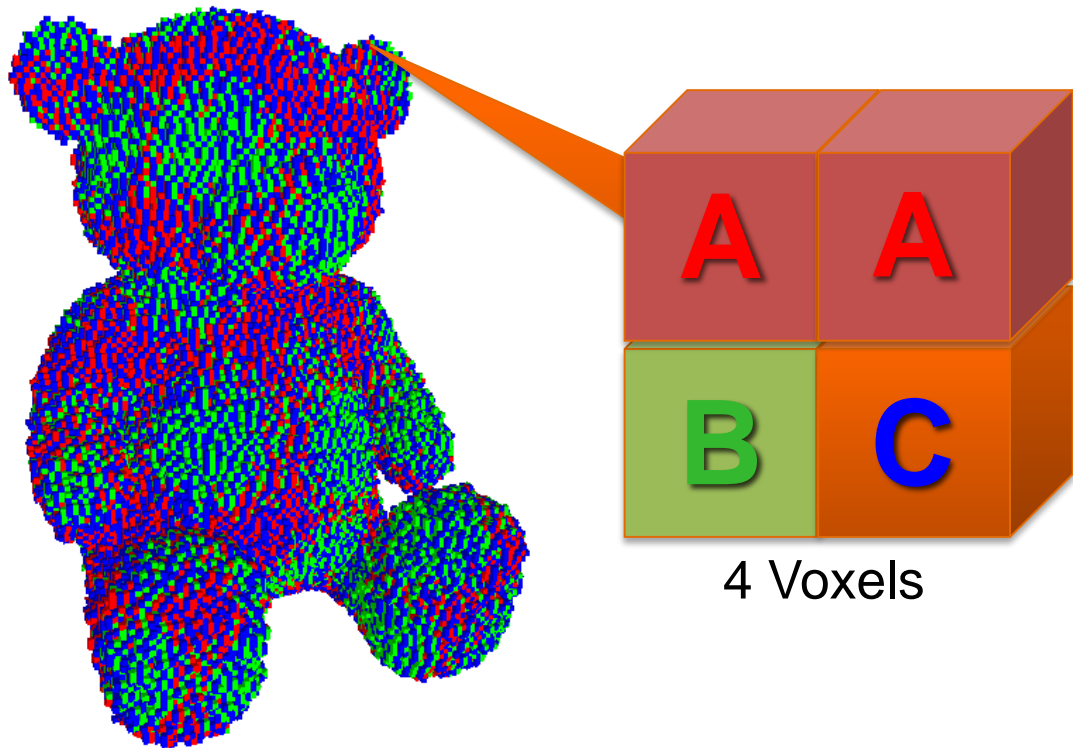

Voxel Representation of Multi-material Objects

- Voxel-based modeling
 - Each voxel maintains information about its composition

Voxel Representation of Multi-material Objects

- Voxel-based modeling
 - Each voxel maintains information about its composition
 - When printing this volume is dithered to obtain a halftoned representation

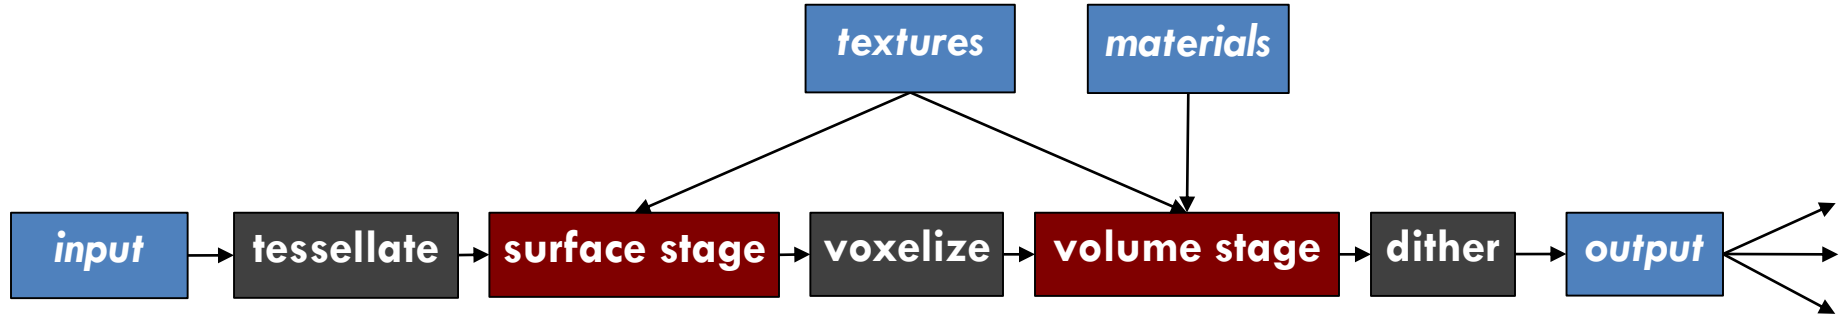

Software Architecture Challenges

- Giga voxels/inch³, Tera voxels/foot³
- Continuous gradation between materials
- Reusable material definitions
- Resolution and printer independence

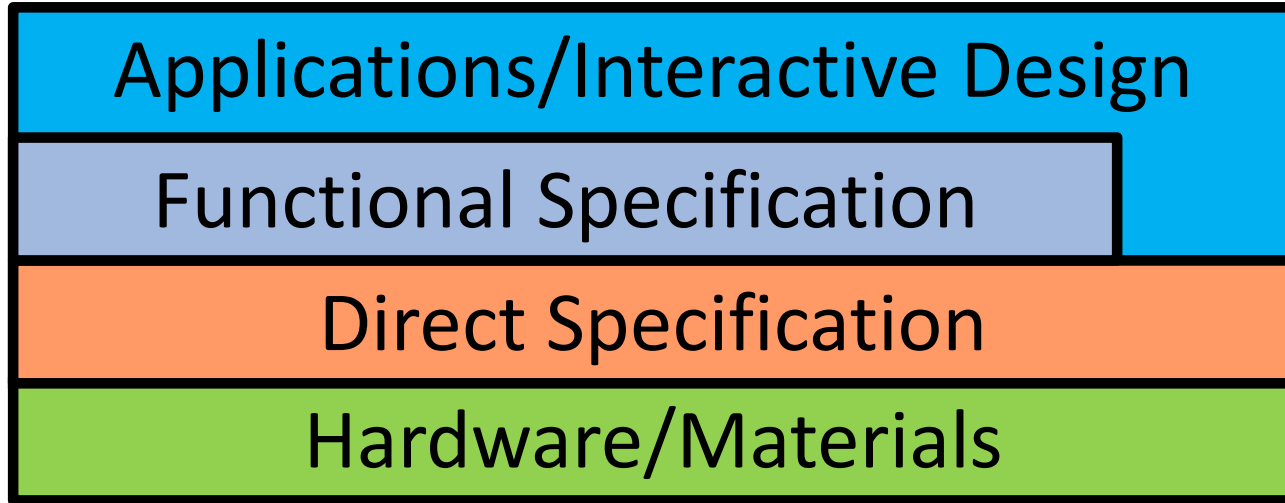

OpenFab [Vidimce 2013]

- Inspired by rendering pipelines
- Fixed stages and programmable stages
- Procedural surface and material definitions
- Resolution independence
- Streaming architecture

OpenFab [Vidimce 2013]

Extended 3D Printing Pipeline
